

To whom it may concern.

Aleksandar Aksentijevic

I have known Aleksandar since 1999 through our shared interest in auditory processing and in my capacity as the organiser of the MSc Audiology course at the School of Audiology, University College London. Since that time, Aleksandar has taught statistics and research methods on this course and has demonstrated high levels of intellectual and organisational ability. I have also had the opportunity of familiarising myself with his doctoral research. I have been impressed by the depth of his knowledge and the depth of his ideas, which link central auditory processing with physiologically plausible temporal mechanisms. More recently, I have become aware of his interest in complexity, which appears very promising and suggests a novel method of studying complex biological structures. Aleksandar is not afraid to challenge established ideas, yet he does this in a measured way, always ensuring his work has a strong empirical backing.

Aleksandar is warm, open and caring person who puts the interest of others first. I have benefited from his advice and friendship. I am convinced that any department that employs Aleksandar will equally benefit from his academic, organisational and personal qualities.
