Introduction

- Conventional mesons: $q\bar{q}$

$$\vec{J} = \vec{L} + \vec{S}$$
$$\left\{ \begin{array}{l} P = (-)^{L+1} \\ C = (-)^{L+S} \end{array} \right\} \Rightarrow CP = (-)^{S+1}$$

- Exotic mesons

$$J^{PC} = 0^{--}, 0^{+-}, 1^{-+}, 2^{+-}, \dots$$

$$\Rightarrow (q\bar{q} + g) \text{ or } (q\bar{q} + q\bar{q})$$

$$CP = (-)^S \text{ in the flux-tube model}$$

Resonances

- **Breit-Wigner form:**

Mass = w_0 and Width = Γ_0

Effective mass = w

$$\begin{aligned}\Delta(w) &= \frac{\Gamma_0 w_0}{w_0^2 - w^2 - i \Gamma_0 w_0} \\ &= e^{i \delta(w)} \sin \delta(w)\end{aligned}$$

- **Phase Shift:**

$$\cot \delta(w) = \frac{w_0^2 - w^2}{\Gamma_0 w_0}$$

Decay in helicity quantization

$\Omega = (\theta, \phi)$ for the primary decay

$\Omega_h = (\theta_h, \phi_h)$ for the secondary decay

For $|JM\rangle \rightarrow |s\lambda\rangle + |\sigma\nu\rangle$, the decay amplitude is

$$A_{\lambda\nu}^J(\theta, \phi, M) \propto D_{M, \lambda-\nu}^{J*}(\phi, \theta, 0) F_{\lambda\nu}^J$$

M. Jacob and G. C. Wick
Ann. Phys. (N.Y.) **7**,404 (1959)

If the angles are zero,

$$A_{\lambda\nu}^J(0, 0; \lambda - \nu) \propto F_{\lambda\nu}^J$$

Decay in canonical quantization

For $|JM\rangle \rightarrow |sm_1\rangle + |\sigma m_2\rangle$, the decay amplitude is

$$A_{\ell S}^J(\theta, \phi; m_1 m_2 M) \propto G_{\ell S}^J(sm_1 \sigma m_2 | S m_s) \sum_m (\ell m S m_s | JM) Y_m^\ell(\theta, \phi)$$

If the angles are zero,

$$A_{\ell S}^J(0, 0; m_1 m_2 m_s) \propto G_{\ell S}^J(sm_1 \sigma m_2 | S m_s) (\ell 0 S m_s | J m_s)$$

and $m_1 = \lambda$ and $m_2 = -\nu$.

Therefore, with $\delta = \lambda - \nu$,

$$F_{\lambda \nu}^J = \sum_{\ell S} \left(\frac{2\ell + 1}{2J + 1} \right)^{1/2} (\ell 0 S \delta | J \delta) (S \lambda \sigma -\nu | S \delta) G_{\ell S}^J$$

M. Jacob and G. C. Wick
Ann. Phys. (N.Y.) **7**,404 (1959)

Two-body decay: $J \rightarrow s + \sigma$

	Parent	Daughter 1	Daughter 2
Spin	J	s	σ
Parity	η_J	η_s	η_σ
Helicity		λ	ν
Momentum	p	q	k
Energy	p_0	q_0	k_0
Mass	W	m	μ
Energy/Mass		γ_s	γ_σ
Velocity		β_s	β_σ
Wave function	$\phi^*(\lambda - \nu)$	$\omega(\lambda)$	$\varepsilon(-\nu)$

where

$$\gamma_s = \frac{q_0}{m}, \quad \gamma_s \beta_s = \frac{q}{m}, \quad \gamma_\sigma = \frac{k_0}{\mu} \quad \text{and} \quad \gamma_\sigma \beta_\sigma = \frac{k}{\mu}$$

and

$$\delta = \lambda - \nu \quad \text{and} \quad r = q - k$$

Momenta and Wave functions

$$\begin{aligned}
 p^\alpha &= (W; 0, 0, 0) \\
 q^\alpha &= (q_0; 0, 0, q) \\
 &= (\gamma_s m; 0, 0, \gamma_s \beta_s m) \\
 k^\alpha &= (k_0; 0, 0, -q) \\
 &= (\gamma_\sigma \mu; 0, 0, -\gamma_\sigma \beta_\sigma \mu) \\
 r^\alpha &= (q_0 - k_0; 0, 0, 2q)
 \end{aligned}$$

and

$$\begin{aligned}
 \phi^\alpha(\pm) &= \mp \frac{1}{\sqrt{2}} (0; 1, \pm i, 0) \\
 \phi^\alpha(0) &= (0; 0, 0, 1) \\
 \omega^\alpha(\pm) &= \mp \frac{1}{\sqrt{2}} (0; 1, \pm i, 0) \\
 \omega^\alpha(0) &= (\gamma_s \beta_s; 0, 0, \gamma_s) \\
 \varepsilon^\alpha(\pm) &= \mp \frac{1}{\sqrt{2}} (0; 1, \pm i, 0) \\
 \varepsilon^\alpha(0) &= (-\gamma_\sigma \beta_\sigma; 0, 0, \gamma_\sigma)
 \end{aligned}$$

Transversality condition:

$$p_\alpha \phi^\alpha(\lambda) = q_\alpha \omega^\alpha(\lambda) = k_\alpha \varepsilon^\alpha(\lambda) = 0$$

Wave functions—continued

$$p_\alpha \phi^\alpha(m) = 0$$

$$\phi_\alpha^*(m) \phi^\alpha(m') = -\delta_{mm'}$$

$$\sum_m \phi_\alpha(m) \phi_\beta^*(m) = \tilde{g}_{\alpha\beta}(W)$$

where the ‘rest-frame metric’ is given by

$$\tilde{g}_{\alpha\beta}(W) = -\bar{g}_{\alpha\beta} + \frac{p_\alpha p_\beta}{W^2} \equiv P_{\alpha\beta}(W)$$

and $P_{\alpha\beta}(W)$ is the spin-1 projection operator.

The wave functions ω and ε obey similar relationships but with their own rest-frame metric:

$$\tilde{g}_{\alpha\beta}(m) = -\bar{g}_{\alpha\beta} + \frac{q_\alpha q_\beta}{m^2}$$

$$\tilde{g}_{\alpha\beta}(\mu) = -\bar{g}_{\alpha\beta} + \frac{k_\alpha k_\beta}{\mu^2}$$

and similarly $P_{\alpha\beta}(m)$ and $P_{\alpha\beta}(\mu)$.

The spin-2 wave function can be written

$$\phi^{\alpha\beta}(m) = \sum_{m_1 m_2} (1m_1 1m_2 | 2m) \phi^\alpha(m_1) \phi^\beta(m_2)$$

where $m = m_1 + m_2$.

Similarly, the spin-3 wave function is

$$\begin{aligned} \phi^{\alpha\beta\gamma}(m) &= \sum_{n_1 m_2} (2n_1 1m_3 | 3m) \phi^{\alpha\beta}(n_1) \phi^\gamma(m_3) \\ &= \sum_{m_1 m_2 m_3} (1m_1 1m_2 | 2n_1) (2n_1 1m_3 | 3m) \\ &\quad \phi^\alpha(m_1) \phi^\beta(m_2) \phi^\gamma(m_3) \end{aligned}$$

where $m = m_1 + m_2 + m_3$.

Note that it is orthogonal to p , symmetric and traceless, i.e.

$$g_{\alpha\beta} \phi^{\alpha\beta}(m) = \tilde{g}_{\alpha\beta}(W) \phi^{\alpha\beta}(m) = 0$$

P. R. Auvil and J. J. Brehm
PR **145**, 1152 (1966)

The spin- J wave function is

$$\phi^{\delta_1 \cdots \delta_J}(m) = [a^J(m)]^{1/2} \sum_{m_0} 2^{m_0/2} \sum_P \phi^{\alpha_1}(+) \cdots \phi^{\beta_1}(0) \cdots \phi^{\gamma_1}(-) \cdots$$

where

$$a^J(m) = \frac{(J+m)!(J-m)!}{(2J)!}$$

The number of terms in the summation is

$$b^J(m, m_0) = \frac{J!}{m_+! m_0! m_-!}$$

where $2m_{\pm} = J \pm m - m_0$ and

$$m_0 : 0(1), 2(3), \dots, J - m = \text{even(odd)}$$

Invariant ℓS -coupling amplitudes

Define a projection operator for orbital angular momenta. It should be a tensor of rank 2ℓ

$$P^\ell = \sum_m \tau^\ell(m) \tau^{\ell*}(m)$$

Relevant invariant amplitude

$$[\tau^{\ell*}(m) \otimes r r \dots] = c_\ell r^\ell \delta_{m0}, \quad c_\ell = \ell! \left[\frac{2^\ell}{(2\ell)!} \right]^{1/2}$$

Consider now a wave function $\chi^S(m_s)$ defined in the J rest frame corresponding to $|Sm_s\rangle$

$$\chi_{\alpha_1 \dots \alpha_s; \beta_1 \dots \beta_\sigma}^S(m_s) = \sum_{m_a m_b} (s m_a \sigma m_b | S m_s) \chi_{\alpha_1 \dots \alpha_s}^s(m_a) \chi_{\beta_1 \dots \beta_\sigma}^\sigma(m_b)$$

This is a tensor of rank $s + \sigma$. The projection operator for the intrinsic spin S is a tensor of rank $2(s + \sigma)$

$$P^S = \sum_{m_s} \chi^S(m_s) \chi^{S*}(m_s)$$

Relevant invariant amplitudes are

$$\begin{aligned} [\chi^{s*}(m_a) \otimes \omega(\lambda)] &= f_\lambda^s(\gamma_s) \delta_{m_a \lambda} \\ [\chi^{\sigma*}(m_b) \otimes \varepsilon(-\nu)] &= f_\nu^\sigma(\gamma_\sigma) \delta_{m_b - \nu} \end{aligned}$$

and the overall invariant amplitude for pure spin S

$$[\omega(\lambda) \otimes \chi^{S*}(m_s) \otimes \varepsilon(-\nu)] = (s\lambda \sigma - \nu | S\delta) f_\lambda^s(\gamma_s) f_\nu^\sigma(\gamma_\sigma) \delta_{m_s \delta}$$

The f-functions are

$$f_m^j(\gamma) = a^j(m) \sum_{m_0} b^j(m, m_0) (2\gamma)^{m_0}$$

Examples are

$$\begin{aligned} f_\lambda^{(1)}(\gamma) &= 1 \quad \text{for } \lambda = \pm 1 \\ &= \gamma \quad \text{for } \lambda = 0 \end{aligned}$$

and

$$\begin{aligned} f_\lambda^{(2)}(\gamma) &= 1 \quad \text{for } \lambda = \pm 2 \\ &= \gamma \quad \text{for } \lambda = \pm 1 \\ &= \frac{2}{3}\gamma^2 + \frac{1}{3} \quad \text{for } \lambda = 0 \end{aligned}$$

Covariant helicity-coupling amplitudes

Nonrelativistic:

$$F_{\lambda\nu}^J = \sum_{\ell S} \left(\frac{2\ell + 1}{2J + 1} \right)^{1/2} (\ell 0 S \delta | J \delta) (S \lambda \sigma -\nu | S \delta) G_{\ell S}^J$$

with $\delta = \lambda - \nu$.

Relativistic:

$$F_{\lambda\nu}^J = \sum_{\ell S} \left(\frac{2\ell + 1}{2J + 1} \right)^{1/2} (\ell 0 S \delta | J \delta) (s \lambda \sigma - \nu | S \delta) \\ (W/W_0)^n (r/r_0)^\ell f_\lambda^s(\gamma_s) f_\nu^\sigma(\gamma_\sigma) G_{ts}^J$$

where

$$n = 1 \quad \text{if} \quad s + \sigma + \ell - J = \text{odd}$$

$$n = 0 \quad \text{if} \quad s + \sigma + \ell - J = \text{even}$$

Number of independent helicity-coupling amplitudes

Define

$$N_J = (a + b + 1)(a - s + \sigma + 1) + (s + \sigma - a)(2J + 1)$$

where

$$a = \min\{J, s + \sigma\}$$

$$b = \min\{J, s - \sigma\}$$

and

$$N_J^{(+)} = (N_J + 1)/2, \quad F_{00}^J \neq 0, \\ \text{if } \eta_J(-)^J = +\eta_s(-)^s \eta_\sigma(-)^\sigma$$

$$N_J^{(-)} = (N_J - 1)/2, \quad F_{00}^J = 0, \\ \text{if } \eta_J(-)^J = -\eta_s(-)^s \eta_\sigma(-)^\sigma$$

I. $\omega(1600) \rightarrow \rho(770) + \pi$

Since $1^- \rightarrow 1^- + 0^-$, one must have $\ell = 1$.

Using the notation,

$$[abcd] = [a b c d] = \epsilon_{\alpha\beta\gamma\delta} a^\alpha b^\beta c^\gamma d^\delta$$

the decay amplitude is

$$F_\lambda \propto [p r \omega(\lambda) \phi^*(\lambda)]$$

so that

$$F_0 = 0 \quad \text{and} \quad F_+ = -F_- \propto W r$$

in the rest frame of $\omega(1600)$.

II. $b_1(1320) \rightarrow \omega(782) + \pi$

Note: $1^+ \rightarrow 1^- + 0^-$ implies $\ell = 0$ or 2 .

Since $(p \cdot \phi^*) = (q \cdot \omega) = 0$ and $p = q + k$,
the decay amplitude could be

$$F_\lambda \propto g_0[\omega(\lambda) \cdot \phi^*(\lambda)] + g_2[k \cdot \omega(\lambda)][q \cdot \phi^*(\lambda)]$$

where

$$[a \cdot b] = \bar{g}_{\alpha\beta} a^\alpha b^\beta = a^\alpha b_\alpha = a_\alpha b^\alpha$$

so that

$$\begin{aligned} F_+ &= F_- \propto g_0 \\ F_0 &= -\gamma_s [g_0 + g_2(W/q_0)q^2] \end{aligned}$$

IIa. $b_1(1320) \rightarrow \omega(782) + \pi$

The decay amplitude can be written

$$\begin{aligned} F_\lambda &\propto g_0 \sum_m [\omega(\lambda) \cdot \chi^*(m)] [\chi(m) \cdot \phi^*(\lambda)] \\ &\quad + g_2 \sum_m [r \cdot \tau^*(m) \cdot r] [\omega(\lambda) \cdot \tau(m) \cdot \phi^*(\lambda)] \\ &\propto g_0 f_\lambda(\gamma_s) [\chi(\lambda) \cdot \phi^*(\lambda)] + g_2 c_2 r^2 [\omega(\lambda) \cdot \tau(0) \cdot \phi^*(\lambda)] \end{aligned}$$

so that, with $c_2 = \sqrt{2/3}$,

$$\begin{aligned} F_+^J &= g_0 - \frac{1}{3} g_2 r^2 \\ F_0^J &= \gamma_s \left(g_0 + \frac{2}{3} g_2 r^2 \right) \end{aligned}$$

where $J = 1$. Or, one can use the general formula, to find

$$\begin{aligned} \sqrt{2} F_+^J &= \sqrt{\frac{2}{3}} g_0 + \sqrt{\frac{1}{3}} g_2 r^2 \\ F_0^J &= \left(\sqrt{\frac{1}{3}} g_0 - \sqrt{\frac{2}{3}} g_2 r^2 \right) \gamma_s \end{aligned}$$

Note

$$g_0 \rightarrow \sqrt{\frac{1}{3}} g_0 \quad \text{and} \quad g_2 \rightarrow -\sqrt{\frac{3}{2}} g_2$$

IIa. Example continued

Consider the angular distribution in $\cos \vartheta$

$$I(\vartheta) \propto \sum_{\lambda} [d_{0\lambda}^J(\vartheta)]^2 |F_{\lambda}^J|^2$$

where $J = 1$.

This leads to a distribution

$$I(\vartheta) \propto |F_0^J|^2 \cos^2(\vartheta) + |F_+^J|^2 \sin^2(\vartheta)$$

so that

$$\begin{aligned} I(\vartheta) \propto & g_0^2 [(\gamma_s^2 - 1) \cos^2(\vartheta) + 1] \\ & + \frac{2}{3} g_0 g_2 r^2 [(2\gamma_s^2 + 1) \cos^2(\vartheta) - 1] \\ & + \frac{1}{9} g_2^2 r^4 [(4\gamma_s^2 - 1) \cos^2(\vartheta) + 1] \end{aligned}$$

Note

$$r = 2q \quad \text{and} \quad \gamma_s^2 = \left(\frac{q^2 + m^2}{m^2} \right)$$

in the J rest frame.

III. Higgs boson decay

Consider a decay $H \rightarrow W^+W^-$.

Since H is a scalar particle, one must have $\ell = S = 0$, $\ell = S = 1$ or $\ell = S = 2$. Assuming parity nonconservation,

$$F_{\pm\pm}^J = \sqrt{\frac{1}{3}}g_{00} \pm \frac{1}{\sqrt{2}}g_{11} W_H r + \sqrt{\frac{1}{6}}g_{22} r^2$$
$$F_{00}^J = \gamma^2 \left(-\sqrt{\frac{1}{3}}g_{00} + \sqrt{\frac{2}{3}}g_{22} r^2 \right)$$

where W_H is the Higgs mass.

In the limit

$$W_H \rightarrow \infty$$

F_{00}^J dominates over $F_{\pm\pm}^J$, i.e. W 's behave like spin-zero particles (Goldstone bosons).

III. Conclusions on $J \rightarrow s + \sigma$

- **Rank- J tensor with a given m**

Derived a general form for a rank- J tensor with a definite m , tensor analogue of the ket state $|Jm\rangle$.

- **Relativistic ℓ - S coupling**

Introduce relativistic concept of total intrinsic spin S and orbital angular momentum ℓ , with two intermediate wave functions $\chi(m_s)$ and $\tau(m)$ (tensor analogues of the ket states $|Sm_s\rangle$ and $|\ell m\rangle$).

- **Covariant helicity-coupling amplitudes**

Covariant helicity-coupling amplitudes $F_{\lambda\nu}^J$ depend in general on W , r , γ_s and γ_σ :

1. W^n , $n=0$ or 1 .
2. r^ℓ , where ℓ is the orbital angular momentum.
3. $F_{\lambda\nu}^J$ is a polynomial of order $s - |\lambda|$ in γ_s or of order $\sigma - |\nu|$ in γ_σ .
4. Photons can be treated on an equal footing (Coulomb gauge).
