which manages and generates high quality graphics of DLG maps in many ways.

Chengdu Institute of Computer Applications, Chinese Academy of Sciences 1988 - 1990

As a project leader or a software engineer, Cheng was involved in a number of application projects in the area of artificial intelligence programming environment, database and GIS systems, and magnetic-card data processing products.

Chengdu Institute of Geography, Chinese Academy of Sciences 1983 - 1985

Cheng was working as an application programmer in the area of computer applications in earth science, particularly, GIS applications in mountain disasters.

Cheng, Gang Research Scientist
Northeast Parallel Architectures Center at Syracuse University

Education

Syracuse University, Syracuse, NY — Ph.D. Candidate, Computer and Information Science, 1991 - date

Huazhong University of Science and Technology, P.R. China — M.S., Computer Science and Engineering, 1985 - 1988
B.S., Computer Science and Engineering, 1979 - 1983

Experience

Northeast Parallel Architectures Center at Syracuse University 1991 - date

Cheng has participated in several MPP application projects at NPAC in the area of financial modeling, electromagnetic scattering simulation, four-dimensional data assimilation, weather modeling and geographic information system. Serving as a system analyst and a researcher in those projects, he has broad experience in developing scientific and industrial applications of parallel computing.

In a financial modeling project funded by Digital Equipment Co. and Syracuse University, Cheng developed a set of parallel stock option pricing models on massively parallel systems, Connection Machines CM2 and CM5, DECmpp-12000, nCUBE2, and on networked workstations. He designed and implemented an interactive visualization environment for this application, in which computational models running on multiple MPP systems and workstations are coupled over a local area network with a network-based graphical user interface.

Cheng has developed a high performance computing and visualization system for an electromagnetic scattering(EMS) simulation. In this DARPA-funded project, he integrated parallel EMS programs on the CM5 into an interactive data visualization environment to take the advantages of high performance computing and sophisticated 3D graphical display.

Cheng is currently playing a major role in a NASA funded "Grand Challenge" application project in four-dimensional data assimilation. The goal of this project is to apply leading research in parallel software and algorithms to a number of existing techniques for data assimilation and to explore new data assimilation methodologies .

Cheng has also actively involved in a variety of other MPP application projects at NPAC. He has extensive expertise in MPP software development, algorithm design and programming, including CM2/5(CMfortran, C*, CMMD, CMX11), DECmpp-12000 (MPFortran, MPL, MPPE), nCUBE2(NDB), Intel iPSC/860(NX, Express, PVM); in network programming, including Express, PVM and TCP/IP, and in computer graphics, including X Window (Xlib, X toolkit and OSF/Motif), AVS, as well as in programming languages such as Fortran, C, C++, SQL, LISP, Prolog.

Information System Support Laboratory, Virginia Tech, VA March - August 1991

Working as an application analyst in the VirGIS(Virginia Geographic Information System) project, Cheng developed a vector-based spatial database management and map display system
