Class awt.WServer

```
java.lang.Object
    |
    +----java.lang.Thread
            |
            +----awt.WServer
```

public class **WServer**
extends Thread

WServer is the class that interacts directly with the native GUI system. The set of native methods it contains defines the platform-independent api that must be implemented for all the platforms it is to run on. Because the platform may necessitate a different division between what is native or not (and what is synchronized or not), this file is platform-dependent. However, all of the public awt classes are always the same and implemented only in Java.
