Mapping of OMG IDL to Java 23

This document contains the output of the Java 1.1 RTF. It indicates the changes to be made to the IDL/Java mapping relative to the CORBA 2.2 (beta) chapter. It also indicates 2 small changes made to the Chapter 5, The DII.

Change bars indicate changes.

As a service to the Security 1.2 RTF, there is some additional changes shown in Red which indicate additions made to the Java Language mapping by that RTF's report.

- Jeff Mischkinsky, Java 1.1 RFT chair - (jeffm@visigenic.com)

This section describes the complete mapping of IDL into the Java language.

Examples of the mapping are provided. It should be noted that the examples are code fragments that try to illustrate only the language construct being described. Normally they will be embedded in some module and hence will be mapped into a Java package.

Contents

This chapter contains the following sections.

Section Title	Page
"Names"	23-2
"Mapping of Module"	23-3
"Mapping for Basic Types"	23-4
"Helper Classes"	23-10
"Mapping for Constant"	23-13

Section Title	Page
“Mapping for Enum”	23-14
“Mapping for Struct”	23-15
“Mapping for Union”	23-17
“Mapping for Sequence”	23-19
“Mapping for Array”	23-20
“Mapping for Interface”	23-22
“Mapping for Exception”	23-25
“Mapping for the Any Type”	23-30
“Mapping for Certain Nested Types”	23-33
“Mapping for Typedef”	23-33
“Mapping Pseudo Objects to Java”	23-34
“Server-Side Mapping”	23-52
“Java ORB Portability Interfaces”	23-54
“It returns a new fully functional ORB Java object each time it is called.Mapping of OMG IDL to Java”	23-67

23.1 Names

In general IDL names and identifiers are mapped to Java names and identifiers with no change. If a name collision could be generated in the mapped Java code, the name collision is resolved by prepending an underscore (_) to the mapped name.

In addition, because of the nature of the Java language, a single IDL construct may be mapped to several (differently named) Java constructs. The “additional” names are constructed by appending a descriptive suffix. For example, the IDL interface **foo** is mapped to the Java interface **foo**, and additional Java classes **fooHelper** and **fooHolder**.

In those exceptional cases that the “additional” names could conflict with other mapped IDL names, the resolution rule described above is applied to the other mapped IDL names. I.e., the naming and use of required “additional” names takes precedence.

For example, an interface whose name is **fooHelper** or **fooHolder** is mapped to **_fooHelper** or **_fooHolder** respectively, regardless of whether an interface named **foo** exists. The helper and holder classes for interface **fooHelper** are named **_fooHelperHelper** and **_fooHelperHolder**.

IDL names that would normally be mapped unchanged to Java identifiers that conflict with Java reserved words will have the collision rule applied.

23.1.1 Reserved Names

The mapping in effect reserves the use of several names for its own purposes. These are:

- The Java class *<type>*`Helper`, where *<type>* is the name of IDL user defined type.
- The Java class *<type>*`Holder`, where *<type>* is the name of an IDL defined type (with certain exceptions such as typedef aliases).
- The Java classes *<basicJavaType>*`Holder`, where *<basicJavaType>* is one of the Java primitive datatypes that is used by one of the IDL basic datatypes (Section , “Holder Classes).
- The nested scope Java package name *<interface>*`Package`, where *<interface>* is the name of an IDL interface (Section 23.14, “Mapping for Certain Nested Types).
- The keywords in the Java language:

abstract	**default**	**if**	**private**	**throw**
boolean	**do**	**implements**	**protected**	**throws**
break	**double**	**import**	**public**	**transient**
byte	**else**	**instanceof**	**return**	**try**
case	**extends**	**int**	**short**	**void**
catch	**final**	**interface**	**static**	**volatile**
char	**finally**	**long**	**super**	**while**
class	**float**	**native**	**switch**	
const	**for**	**new**	**synchronized**	
continue	**goto**	**package**	**this**	

The use of any of these names for a user defined IDL type or interface (assuming it is also a legal IDL name) will result in the mapped name having an (_) prepended.

23.2 Mapping of Module

An IDL module is mapped to a Java package with the same name. All IDL type declarations within the module are mapped to corresponding Java class or interface declarations within the generated package.

IDL declarations not enclosed in any modules are mapped into the (unnamed) Java global scope.

23.2.1 Example

```
// IDL
module Example {...}

// generated Java
package Example;
    ...
```

23.3 Mapping for Basic Types

23.3.1 Introduction

The following table shows the basic mapping. In some cases where there is a potential mismatch between an IDL type and its mapped Java type, the Exceptions column lists the standard CORBA exceptions that may be (or is) raised. See Section 23.12, "Mapping for Exception for details on how IDL system exceptions are mapped.

The potential mismatch can occur when the range of the Java type is "larger" than IDL. The value must be effectively checked at runtime when it is marshaled as an in parameter (or on input for an inout), e.g. Java chars are a superset of IDL chars.

Users should be careful when using unsigned types in Java. Because there is no support in the Java language for unsigned types, a user is responsible for ensuring that large unsigned IDL type values are handled correctly as negative integers in Java.

Figure 23-1 BASIC TYPE MAPPINGS

IDL Type	Java type	Exceptions
boolean	`boolean`	
char	`char`	**CORBA::DATA_CONVERSIO**
wchar	`char`	**CORBA::DATA_CONVERSIO**
octet	`byte`	
string	`java.lang.String`	**CORBA::MARSHAL** **CORBA::DATA_CONVERSIO**
wstring	`java.lang.String`	**CORBA::MARSHAL** **CORBA::DATA_CONVERSIO**
short	`short`	
unsigned short	`short`	
long	`int`	
unsigned long	`int`	
long long	`long`	
unsigned long long	`long`	
float	`float`	
double	`double`	

Future Support

In the future it is expected that the "new" extended IDL types fixed, and possibly long double, to be supported directly by Java. Currently there is no support for them in JDK 1.0.2, and as a practical matter, they are not yet widely supported by ORB vendors. It is expected that they would be mapped as follows:

IDL Type	Java type	Exceptions
long double	`not available at this time`	
fixed	`java.math.BigDecimal`	CORBA::DATA_CONVERSION

Holder Classes

Support for out and inout parameter passing modes requires the use of additional "holder" classes. These classes are available for all of the basic IDL datatypes in the **`org.omg.CORBA`** package and are generated for all named user defined types except those defined by typedefs.

For user defined IDL types, the holder class name is constructed by appending **`Holder`** to the mapped (Java) name of the type.

For the basic IDL datatypes, the holder class name is the Java type name (with its initial letter capitalized) to which the datatype is mapped with an appended **`Holder`**, (e.g. **`IntHolder`**.)

Each holder class has a constructor from an instance, a default constructor, and has a public instance member, **`value`**, which is the typed value. The default constructor sets the value field to the default value for the type as defined by the Java language: **`false`** for boolean, **`0`** for numeric and char types, **`null`** for strings, null for object references.

In order to support portable stubs and skeletons, holder classes for user defined types also have to implement the **`org.omg.CORBA.portable.Streamable`** interface.

The holder classes for the basic types are defined below. Note that they do not implement the **`Streamable`** interface. They are in the **`org.omg.CORBA`** package.

```
// Java

package org.omg.CORBA;

final public class ShortHolder {
    public short value;
    public ShortHolder() {}
    public ShortHolder(short initial) {
        value = initial;
    }
}

final public class IntHolder {
    public int value;
    public IntHolder() {}
    public IntHolder(int initial) {
        value = initial;
    }
}

final public class LongHolder {
    public long value;
    public LongHolder() {}
    public LongHolder(long initial) {
        value = initial;
    }
}

final public class ByteHolder {
    public byte value;
    public ByteHolder() {}
    public ByteHolder(byte initial) {
        value = initial;
    }
}

final public class FloatHolder {
    public float value;
    public FloatHolder() {}
    public FloatHolder(float initial) {
        value = initial;
    }
}

final public class DoubleHolder {
    public double value;
    public DoubleHolder() {}
    public DoubleHolder(double initial) {
        value = initial;
    }
}
```

```
final public class CharHolder {
    public char value;
    public CharHolder() {}
    public CharHolder(char initial) {
        value = initial;
    }
}

final public class BooleanHolder {
    public boolean value;
    public BooleanHolder() {}
    public BooleanHolder(boolean initial) {
        value = initial;
    }
}

final public class StringHolder {
    public java.lang.String value;
    public StringHolder() {}
    public StringHolder(java.lang.String initial) {
        value = initial;
    }
}

final public class ObjectHolder {
    public org.omg.CORBA.Object value;
    public ObjectHolder() {}
    public ObjectHolder(org.omg.CORBA.Object initial) {
        value = initial;
    }
}

final public class AnyHolder {
    public Any value;
    public AnyHolder() {}
    public AnyHolder(Any initial) {
        value = initial;
    }
}

final public class TypeCodeHolder {
    public TypeCode value;
    public typeCodeHolder() {}
    public TypeCodeHolder(TypeCode initial) {
        value = initial;
    }
}
```

```
final public class PrincipalHolder {
    public Principal value;
    public PrincipalHolder() {}
    public PrincipalHolder(Principal initial) {
        value = initial;
    }
}
```

The Holder class for a user defined type <foo> is shown below:

```
// Java
final public class <foo>Holder
    implements org.omg.CORBA.portable.Streamable {

    public <foo> value;
    public <foo>Holder() {}
    public <foo>Holder(<foo> initial) {}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
    }
```

Use of Java `null`

The Java `null` may only be used to represent the "null" object reference. For example, a zero length string, rather than `null` must be used to represent the empty string. Similarly for arrays.

23.3.2 Boolean

The IDL boolean constants **TRUE** and **FALSE** are mapped to the corresponding Java boolean literals `true` and `false`.

23.3.3 Character Types

IDL characters are 8-bit quantities representing elements of a character set while Java characters are 16-bit unsigned quantities representing Unicode characters. In order to enforce type-safety, the Java CORBA runtime asserts range validity of all Java `chars` mapped from IDL **chars** when parameters are marshaled during method invocation. If the `char` falls outside the range defined by the character set, a **CORBA::DATA_CONVERSION** exception shall be thrown.

The IDL **wchar** maps to the Java primitive type `char`. If the wchar falls outside the range defined by the character set, a **CORBA::DATA_CONVERSION** exception shall be thrown.

23.3.4 Octet

The IDL type **octet**, an 8-bit quantity, is mapped to the Java type `byte`.

23.3.5 String Types

The IDL **string**, both bounded and unbounded variants, are mapped to `java.lang.String`. Range checking for characters in the string as well as bounds checking of the string shall be done at marshal time. Character range violations cause a **CORBA::DATA_CONVERSION** exception to be raised. Bounds violations cause a **CORBA:: MARSHAL** exception to be raised.

The IDL **wstring**, both bounded and unbounded variants, are mapped to `java.lang.String`. Bounds checking of the string shall be done at marshal time. Character range violations cause a **CORBA::DATA_CONVERSION** exception to be raised. Bounds violations cause a **CORBA:: MARSHAL** exception to be raised.

23.3.6 Integer Types

The integer types map as shown in Figure 23-1.

23.3.7 Floating Point Types

The IDL float and double map as shown in Figure 23-1.

23.3.8 Future Fixed Point Types

The IDL **fixed** type is mapped to the Java **java.math.BigDecimal** class. Size violations raises a **CORBA::DATA_CONVERSION** exception.

This is left for a future revision.

23.3.9 Future Long Double Types

There is no current support in Java for the IDL **long double** type. It is not clear at this point whether and when this type will be added either as a primitive type, or as a new package in **java.math.***, possibly as **java.math.BigFloat**.

This is left for a future revision.

23.4 Helper Classes

All user defined IDL types have an additional "helper" Java class with the suffix **Helper** appended to the type name generated. Several static methods needed to manipulate the type are supplied. These include **Any** insert and extract operations for the type, getting the repository id, getting the typecode, and reading and writing the type from and to a stream.

For any user defined IDL type, <**typename**>, the following is the Java code generated for the type. In addition, the helper class for a mapped IDL interface also has a narrow operation defined for it.

```
// generated Java helper

public class <typename>Helper {
    public static void
        insert(org.omg.CORBA.Any a, <typename> t) {...}
    public static <typename> extract(Any a) {...}
    public static org.omg.CORBA.TypeCode type() {...}
    public static String id() {...}
    public static <typename> read(
                org.omg.CORBA.portable.InputStream istream)
        {...}
    public static void write(
                org.omg.CORBA.portable.OutputStream ostream,
                <typename> value)
        {...}

    // only for interface helpers
    public static
        <typename> narrow(org.omg.CORBA.Object obj);
}
```

The helper class associated with an IDL interface also has the narrow method.

23.4.1 Examples

```
// IDL - named type
struct st {long f1; string f2;};

// generated Java
public class stHelper {
      public static void insert(org.omg.CORBA.Any any,
            st s) {...}
      public static st extract(Any a) {...}
      public static org.omg.CORBA.TypeCode type() {...}
      public static String id() {...}
      public static st read(org.omg.CORBA.InputStream is) {...}
      public static void write(org.omg.CORBA.OutputStream os,
             st s) {...}
}

// IDL - typedef sequence
typedef sequence <long> IntSeq;

// generated Java helper

public class IntSeqHelper {
      public static void insert(org.omg.CORBA.Any any,
                                                        int[] seq);
      public static int[] extract(Any a){...}
      public static org.omg.CORBA.TypeCode type(){...}
      public static String id(){...}
      public static int[] read(
                                    org.omg.CORBA.portable.InputStream is)
            {...}
      public static void write(
                                    org.omg.CORBA.portable.OutputStream os,
                                    int[] seq)
            {...}
}
```

23.5 Mapping for Constant

Constants are mapped differently depending upon the scope in which they appear.

23.5.1 Constants Within An Interface

Constants declared within an IDL interface are mapped to `public static final` fields in the Java interface corresponding to the IDL interface.

Example

```
// IDL

module Example {
        interface Face {
        const long aLongerOne = -321;
    };
};

// generated Java

package Example;
public interface Face {
    public static final int aLongerOne = (int) (-321L);
}
```

23.5.2 Constants Not Within An Interface

Constants not declared within an IDL interface are mapped to a `public interface` with the same name as the constant and containing a `public static final` field, named `value`, that holds the contant's value. Note that the Java compiler will normally inline the value when the class is used in other Java code.

Example

```
// IDL

module Example {
    const long aLongOne = -123;
};

package Example;
public interface aLongOne {
    public static final int value = (int) (-123L);
}
```

23.6 Mapping for Enum

An IDL **enum** is mapped to a Java **final class** with the same name as the enum type which declares a value method, two static data members per label, an integer conversion method, and a private constructor as follows:

```
// generated Java

public final class <enum_name> {

    // one pair for each label in the enum
    public static final int _<label> = <value>;
    public static final <enum_name> <label> =
        new <enum_name>(_<label>);

    public int value() {...}

    // get enum with specified value
    public static <enum_name> from_int(int value);

    // constructor
    private <enum_name>(int) { ... }
}
```

One of the members is a **public static final** that has the same name as the IDL enum label. The other has an underscore (_) prepended and is intended to be used in switch statements.

The value method returns the integer value. Values are assigned sequentially starting with 0. Note: there is no conflict with the **value()** method in Java even if there is a label named value

There shall be only one instance of an enum. Since there is only one instance, equality tests will work correctly. I.E. the default java.lang.Object implementation of **equals()** and **hash()** will automatically work correctly for an enum's singleton object.

The Java class for the enum has an additional method **from_int()**, which returns the enum with the specified value.

The holder class for the enum is also generated. Its name is the enum's mapped Java classname with **Holder** appended to it as follows:

```
public class <enum_name>Holder implements
        org.omg.CORBA.portable.Streamable {
    public <enum_name> value;
    public <enum_name>Holder() {}
    public <enum_name>Holder(<enum_name> initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.6.1 Example

```
// IDL
enum EnumType {a, b, c};

// generated Java

public final class EnumType {

    public static final int _a = 0;
    public static final EnumType a = new EnumType(_a);

    public static final int _b = 1;
    public static final EnumType b = new EnumType(_b);

    public static final int _c = 2;
    public static final EnumType c = new EnumType(_c);

    public int value() {...}
    public static EnumType from_int(int value) {...};

    // constructor
    private EnumType(int) {...}

    };
```

23.7 Mapping for Struct

An IDL **struct** is mapped to a final Java class with the same name that provides instance variables for the fields in IDL member ordering and a constructor for all values. A null constructor is also provided so that the fields can be filled in later.

The holder class for the struct is also generated. Its name is the struct's mapped Java classname with `Holder` appended to it as follows:

```
final public class <class>Holder implements
        org.omg.CORBA.portable.Streamable {
    public <class> value;
    public <class>Holder() {}
    public <class>Holder(<class> initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.7.1 Example

```
// IDL
struct StructType {
    long field1;
    string field2;
};

// generated Java
final public class StructType {
    // instance variables
    public int field1;
    public String field2;
    // constructors
    public StructType() {}
    public StructType(int field1, String field2)
        {...}
    }

final public class StructTypeHolder
        implements org.omg.CORBA.portable.Streamable {
    public StructType value;
    public StructTypeHolder() {}
    public StructTypeHolder(StructType initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
```

23.8 Mapping for Union

An IDL **union** is mapped to a final Java class with the same name that has:

- a default constructor
- an accessor method for the discriminator, named **discriminator()**
- an accessor method for each branch
- a modifier method for branch
- a modifier method for each branch which has more than one case label.
- a default modifier method if needed

The normal name conflict resolution rule is used (prepend an "_") for the discriminator if there is a name clash with the mapped uniontype name or any of the field names.

The branch accessor and modifier methods are overloaded and named after the branch. Accessor methods shall raise the **CORBA::BAD_OPERATION** system exception if the expected branch has not been set.

If there is more than one case label corresponding to a branch, the simple modifier method for that branch sets the discriminant to the value of the first case label. In addition, an extra modifier method which takes an explicit discriminator parameter is generated.

If the branch corresponds to the **default** case label, then the modifier method sets the discriminant to a value that does not match any other case labels.

It is illegal to specify a union with a default case label if the set of case labels completely covers the possible values for the discriminant. It is the responsibility of the Java code generator (e.g., the IDL complier, or other tool) to detect this situation and refuse to generate illegal code.

A default modifier method, named **__default()** is created if there is no explicit default case label, and the set of case labels does not completely cover the possible values of the discriminant. It will set the value of the discriminant to a value that does not match any other case labels. The value of the union may be left uninitialized.

The holder class for the union is also generated. Its name is the union's mapped Java classname with **Holder** appended to it as follows:

```
final public class <union_class>Holder
        implements org.omg.CORBA.portable.Streamable {
    public <union_class> value;
    public <union_class>Holder() {}
    public <union_class>Holder(<union_class> initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.8.1 Example

```
// IDL
union UnionType switch (EnumType) {
        case first: long win;
        case second: short place;
        case third:
        case fourth: octet show;
        default:    boolean other;
};

// generated Java
final public class UnionType {
    // constructor
    public UnionType() {....}

    // discriminator accessor
    public <switch-type> discriminator() {....}

    // win
    public int win() {....}
    public void win(int value) {....}

    // place
    public short place() {....}
    public void place(short value) {....}

    // show
    public byte show() {....}
    public void show(byte value) {....}
    public void show(int discriminator, byte value){....}

    // other
    public boolean other() {....}
    public void other(boolean value) {....}

}
```

```
final public class UnionTypeHolder
        implements org.omg.CORBA.portable.Streamable {
    public UnionType value;
    public UnionTypeHolder() {}
    public UnionTypeHolder(UnionType initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.9 Mapping for Sequence

An IDL **sequence** is mapped to a Java array with the same name. In the mapping, everywhere the sequence type is needed, an array of the mapped type of the sequence element is used. Bounds checking shall be done on bounded sequences when they are marshaled as parameters to IDL operations, and an IDL **CORBA::MARSHAL** is raised if necessary.

The holder class for the sequence is also generated. Its name is the sequence's mapped Java classname with **Holder** appended to it as follows:

```
final public class <sequence_class>Holder {
    public <sequence_element_type>[ ] value;
    public <sequence_class>Holder() {};
    public <sequence_class>Holder(
                    <sequence_element_type>[ ] initial) {...};
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.9.1 Example

```
// IDL
typedef sequence< long > UnboundedData;
typedef sequence< long, 42 > BoundedData;

// generated Java

final public class UnboundedDataHolder
            implements org.omg.CORBA.portable.Streamable {
    public int[ ] value;
    public UnboundedDataHolder() {};
    public UnboundedDataHolder(int[ ] initial) {...};
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}

final public class BoundedDataHolder
            implements org.omg.CORBA.portable.Streamable {
    public int[ ] value;
    public BoundedDataHolder() {};
    public BoundedDataHolder(int[ ] initial) {...};
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.10 Mapping for Array

An IDL array is mapped the same way as an IDL bounded sequence. In the mapping, everywhere the array type is needed, an array of the mapped type of the array element is used. In Java, the natural Java subscripting operator is applied to the mapped array. The bounds for the array are checked when the array is marshaled as an argument to an IDL operation and a **CORBA::MARSHAL** exception is raised if an bounds violation occurs. The length of the array can be made available in Java, by bounding the array with an IDL constant, which will be mapped as per the rules for constants.

The holder class for the array is also generated. Its name is the array's mapped Java classname with **Holder** appended to it as follows:

```
final public class <array_class>Holder
        implements org.omg.CORBA.portable.Streamable {
    public <array_element_type>[ ] value;
    public <array_class>Holder() {}
    public <array_class>Holder(
                    <array_element_type>[ ] initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.10.1 Example

```
// IDL

const long ArrayBound = 42;
typedef long larray[ArrayBound];

// generated Java

final public class larrayHolder
        implements org.omg.CORBA.portable.Streamable {
    public int[ ] value;
    public larrayHolder() {}
    public larrayHolder(int[ ] initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.11 Mapping for Interface

23.11.1 Basics

An IDL **interface** is mapped to a public Java interface with the same name, and an additional "helper" Java class with the suffix `Helper` appended to the interface name. The Java interface extends the (mapped) base `org.omg.CORBA.Object` interface.

The Java interface contains the mapped operation signatures. Methods can be invoked on an object reference to this interface.

The helper class holds a static narrow method that allows a `org.omg.CORBA.Object` to be narrowed to the object reference of a more specific type. The IDL exception **CORBA::BAD_PARAM** is thrown if the narrow fails.

There are no special "nil" object references. Java `null` can be passed freely wherever an object reference is expected.

Attributes are mapped to a pair of Java accessor and modifier methods. These methods have the same name as the IDL attribute and are overloaded. There is no modifier method for IDL **readonly** attributes.

The holder class for the interface is also generated. Its name is the interface's mapped Java classname with `Holder` appended to it as follows:

```
final public class <interface_class>Holder
        implements org.omg.CORBA.portable.Streamable {
    public <interface_class> value;
    public <interface_class>Holder() {}
    public <interface_class>Holder(
                    <interface_class> initial) {
        value = initial;
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

Interface inheritance expressed in IDL is reflected directly in the Java interface hierarchy.

Example

```
// IDL

module Example {
    interface Face {
        long method (in long arg) raises (e);
        attribute long assignable;
        readonly attribute long nonassignable;
    }
}
```

```
// generated Java

package Example;

public interface Face extends org.omg.CORBA.Object {
    int method(int arg)
        throws Example.e;
    int assignable();
    void assignable(int i);
    int nonassignable();
}

public class FaceHelper {

    // ... other standard helper methods

    public static Face narrow(org.omg.CORBA.Object obj)
        {...}
}

final public class FaceHolder
        implements org.omg.CORBA.portable.Streamable {
    public Face value;
    public FaceHolder() {}
    public FaceHolder(Face initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.11.2 Parameter Passing Modes

IDL **in** parameters which implement call-by-value semantics, are mapped to normal Java actual parameters. The results of IDL operations are returned as the result of the corresponding Java method.

IDL **out** and **inout** parameters, which implement call-by-result and call-by-value/result semantics, cannot be mapped directly into the Java parameter passing mechanism. This mapping defines additional holder classes for all the IDL basic and user-defined types which are used to implement these parameter modes in Java. The client supplies an instance of the appropriate holder Java class that is passed (by value) for each IDL out or inout parameter. The contents of the holder instance (but not the instance itself) are modified by the invocation, and the client uses the (possibly) changed contents after the invocation returns.

Example

```
// IDL

module Example {
    interface Modes {
        long operation(in long inArg,
                       out long outArg,
                       inout long inoutArg);
    };
};

// Generated Java

package Example;

public interface Modes {
    int operation(int inArg,
                  IntHolder outArg,
                  IntHolder inoutArg);
}
```

In the above, the result comes back as an ordinary result and the actual in parameters only an ordinary value. But for the out and inout parameters, an appropriate holder must be constructed. A typical use case might look as follows:

```
// user Java code

// select a target object
Example.Modes target = ...;

// get the in actual value
int inArg = 57;
```

```
// prepare to receive out
IntHolder outHolder = new IntHolder();

// set up the in side of the inout
IntHolder inoutHolder = new IntHolder(131);

// make the invocation
int result =target.operation(inArg, outHolder, inoutHolder);

// use the value of the outHolder
... outHolder.value ...

// use the value of the inoutHolder
... inoutHolder.value ...
```

Before the invocation, the input value of the inout parameter must be set in the holder instance that will be the actual parameter. The inout holder can be filled in either by constructing a new holder from a value, or by assigning to the value of an existing holder of the appropriate type. After the invocation, the client uses the outHolder.value to access the value of the out parameter, and the inoutHolder.value to access the output value of the inout parameter. The return result of the IDL operation is available as the result of the invocation.

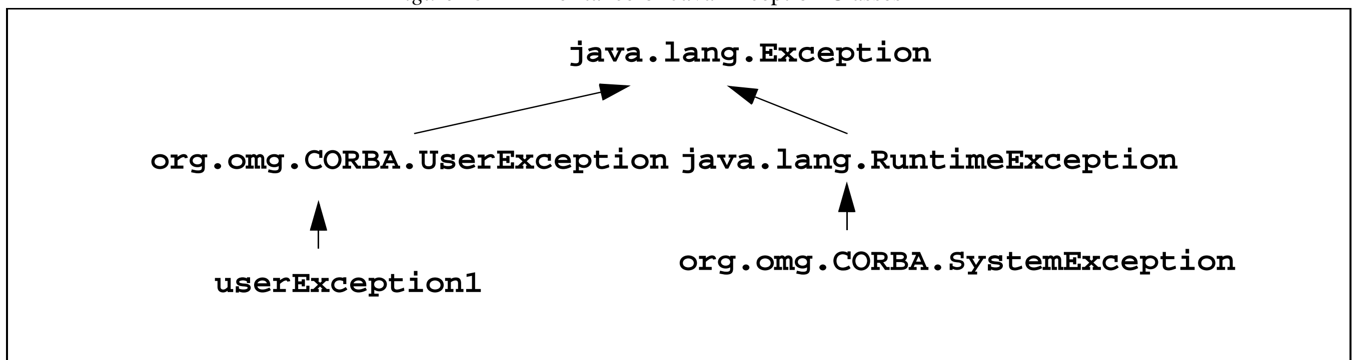
23.12 Mapping for Exception

IDL exceptions are mapped very similarly to structs. They are mapped to a Java class that provides instance variables for the fields of the exception and constructors.

CORBA system exceptions are unchecked exceptions. They inherit (indirectly) from `java.lang.RuntimeException`.

User defined exceptions are checked exceptions. They inherit (indirectly) from `java.lang.Exception`

Figure 23-2 Inheritance of Java Exception Classes



23.12.1 User Defined Exceptions

User defined exceptions are mapped to final Java classes that extend **org.omg.CORBA.UserException** and are otherwise mapped just like the IDL **struct** type, including the generation of Helper and Holder classes.

If the exception is defined within a nested IDL scope (essentially within an interface) then its Java class name is defined within a special scope. See Section 23.14, "Mapping for Certain Nested Types for more details. Otherwise its Java class name is defined within the scope of the Java package that corresponds to the exception's enclosing IDL module.

Example

```
// IDL

module Example {
    exception ex1 { string reason; };
};

// Generated Java

package Example;
final public class ex1 extends org.omg.CORBA.UserException {
    public String reason;                    // instance
    public ex1() {...}                       // default constructor
    public ex1(String r) {...}               // constructor
}

final public class ex1Holder
        implements org.omg.CORBA.portable.Streamable {
    public ex1 value;
    public ex1Holder() {}
    public ex1Holder(ex1 initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

Unknown User Exception

There is one standard user exception, the unknown user exception and is specified as follows:

```
package org.omg.CORBA;
final public class UnknownUserException extends org.omg.CORBA.UserException {
    public Any except;
    public UnknownUserException() {
        super();
        }
    public UnknownUserException(Any a) {
        super();
        except = a;
    }
}

final public class UnknownUserExceptionHolder
        implements org.omg.CORBA.portable.Streamable {
    public UnknownUserException value;
    public UnknownUserExceptionHolder() {}
    public UnknownUserExceptionHolder(UnknownUserException initial) {...}
    public void _read(org.omg.CORBA.portable.InputStream i)
        {...}
    public void _write(org.omg.CORBA.portable.OutputStream o)
        {...}
    public org.omg.CORBA.TypeCode _type() {...}
}
```

23.12.2 System Exceptions

The standard IDL system exceptions are mapped to final Java classes that extend `org.omg.CORBA.SystemException` and provide access to the IDL major and minor exception code, as well as a string describing the reason for the exception.Note there are no public constructors for `org.omg.CORBA.SystemException`; only classes that extend it can be instantiated.

The Java class name for each standard IDL exception is the same as its IDL name and is declared to be in the `org.omg.CORBA` package. The default constructor supplies 0 for the minor code, COMPLETED_NO for the completion code, and "" for the reason string. There is also a constructor which takes the reason and uses defaults for the other fields, as well as one which requires all three parameters to be specified. The mapping from IDL name to Java class name is listed in the table below:

Table 23-1 Mapping of IDL Standard Exceptions

IDL Exception	Java Class Name
CORBA::UNKNOWN	`org.omg.CORBA.UNKNOWN`
CORBA::BAD_PARAM	`org.omg.CORBA.BAD_PARAM`

Table 23-1 Mapping of IDL Standard Exceptions

IDL Exception	Java Class Name
CORBA::NO_MEMORY	org.omg.CORBA.NO_MEMORY
CORBA::IMP_LIMIT	org.omg.CORBA.IMP_LIMIT
CORBA::COMM_FAILURE	org.omg.CORBA.COMM_FAILURE
CORBA::INV_OBJREF	org.omg.CORBA.INV_OBJREF
CORBA::NO_PERMISSION	org.omg.CORBA.NO_PERMISSION
CORBA::INTERNAL	org.omg.CORBA.INTERNAL
CORBA::MARSHAL	org.omg.CORBA.MARSHAL
CORBA::INITIALIZE	org.omg.CORBA.INITIALIZE
CORBA::NO_IMPLEMENT	org.omg.CORBA.NO_IMPLEMENT
CORBA::BAD_TYPECODE	org.omg.CORBA.BAD_TYPECODE
CORBA::BAD_OPERATION	org.omg.CORBA.BAD_OPERATION
CORBA::NO_RESOURCES	org.omg.CORBA.NO_RESOURCES
CORBA::NO_RESPONSE	org.omg.CORBA.NO_RESPONSE
CORBA::PERSIST_STORE	org.omg.CORBA.PERSIST_STORE
CORBA::BAD_INV_ORDER	org.omg.CORBA.BAD_INV_ORDER
CORBA::TRANSIENT	org.omg.CORBA.TRANSIENT
CORBA::FREE_MEM	org.omg.CORBA.FREE_MEM
CORBA::INV_IDENT	org.omg.CORBA.INV_IDENT
CORBA::INV_FLAG	org.omg.CORBA.INV_FLAG
CORBA::INTF_REPOS	org.omg.CORBA.INTF_REPOS
CORBA::BAD_CONTEXT	org.omg.CORBA.BAD_CONTEXT
CORBA::OBJ_ADAPTER	org.omg.CORBA.OBJ_ADAPTER
CORBA::DATA_CONVERSION	org.omg.CORBA.DATA_CONVERSION
CORBA::OBJECT_NOT_EXIST	org.omg.CORBA.OBJECT_NOT_EXIST
CORBA::TRANSACTIONREQUIRED	org.omg.CORBA.TRANSACTIONREQUIRED
CORBA::TRANSACTIONROLLEDBACK	org.omg.CORBA.TRANSACTIONROLLEDBACK
CORBA::INVALIDTRANSACTION	org.omg.CORBA.INVALIDTRANSACTION

The definitions of the relevant classes are specified below.

```
// from org.omg.CORBA package

package org.omg.CORBA;

public final class CompletionStatus {
    // Completion Status constants
    public static final int _COMPLETED_YES = 0,
                            _COMPLETED_NO = 1,
                            _COMPLETED_MAYBE = 2;
    public static final CompletionStatus COMPLETED_YES =
        new CompletionStatus(_COMPLETED_YES);
    public static final CompletionStatus COMPLETED_NO =
        new CompletionStatus(_COMPLETED_NO);
    public static final CompletionStatus COMPLETED_MAYBE =
        new CompletionStatus(_COMPLETED_MAYBE);
    public int value() {...}
    public static final CompletionStatus from_int(int) {...}
    private CompletionStatus(int) {...}
}

abstract public class
    SystemException extends java.lang.RuntimeException {
        public int minor;
        public CompletionStatus completed;
        // constructor
        protected SystemException(String reason,
                        int minor,
                        CompletionStatus status) {
            super(reason);
            this.minor = minor;
            this.status = status;
        }
    }

final public class
    UNKNOWN extends org.omg.CORBA.SystemException {
    public UNKNOWN() ...
    public UNKNOWN(int minor, CompletionStatus completed) ...
    public UNKNOWN(String reason) ...
    public UNKNOWN(String reason, int minor,
                    CompletionStatus completed)...
}

...

// there is a similar definition for each of the standard
// IDL system exceptions listed in the table above
```

23.13 Mapping for the Any Type

The IDL type **Any** maps to the Java class **org.omg.CORBA.Any**. This class has all the necessary methods to insert and extract instances of predefined types. If the extraction operations have a mismatched type, the **CORBA::BAD_OPERATION** exception is raised.

In addition, insert and extract methods which take a holder class are defined in order to provide a high speed interface for use by portable stubs and skeletons. There is an insert and extract method defined for each primitive IDL type as well as a pair for a generic streamable to handle the case of non-primitive IDL types. Note that to preserve unsigned type information unsigned methods (which use the normal holder class) are defined where appropriate.

The insert operations set the specified value and reset the any's type if necessary.

Except for the primitive IDL types, the insert and extract methods shall implement reference semantics. For the non primitive IDL types, an **Any** is a container for the data that is inserted and held. It does not copy or preserve the state of the instance that it holds when the insert method is invoked. The contents of the **Any** are not serialized until the **Any** is passed out of the address space, the **write_value()** method is invoked, or **create_input_stream()** method is invoked. Invoking **create_output_stream()** and writing to the **Any**, or by calling **read_value()**, the **Any** will update the state of the last instance that was inserted into it, if any. Similarily, calling an extract method multiple times will return the same contained instance.

Setting the typecode via the **type()** accessor wipes out the value. An attempt to extract before the value is set will result in a **CORBA::BAD_OPERATION** exception being raised. This operation is provided primarily so that the type may be set properly for IDL **out** parameters.

```
package org.omg.CORBA;

abstract public class Any {

abstract public boolean equal(org.omg.CORBA.Any a);

// type code accessors
abstract public org.omg.CORBA.TypeCode type();
abstract public void type(org.omg.CORBA.TypeCode t);

// read and write values to/from streams
//          throw excep when typecode inconsistent with value
abstract public void read_value(
      org.omg.CORBA.portable.InputStream is,
      org.omg.CORBA.TypeCode t) throws org.omg.CORBA.MARSHAL;
abstract public void
      write_value(org.omg.CORBA.portable.OutputStream os);
```

```
abstract public org.omg.CORBA.portable.OutputStream
            create_output_stream();
abstract public org.omg.CORBA.portable.InputStream
            create_input_stream();

// insert and extract each primitive type

abstract public short           extract_short()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_short(short s);

abstract public int             extract_long()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_long(int i);

abstract public long            extract_longlong()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_longlong(long l);

abstract public short           extract_ushort()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_ushort(short s);

abstract public int             extract_ulong()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_ulong(int i);

abstract public long            extract_ulonglong()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_ulonglong(long l);

abstract public float           extract_float()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_float(float f);

abstract public double          extract_double()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_double(double d);

abstract public boolean         extract_boolean()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_boolean(boolean b);

abstract public char            extract_char()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_char(char c)
    throws org.omg.CORBA.DATA_CONVERSION;

abstract public char            extract_wchar()
    throws org.omg.CORBA.BAD_OPERATION;
abstract public void            insert_wchar(char c);
```

```
abstract public byte                    extract_octet()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void                    insert_octet(byte b);

abstract public org.omg.CORBA.Any extract_any()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void                    insert_any(org.omg.CORBA.Any a);

abstract public org.omg.CORBA.Object    extract_Object()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void                   insert_Object(
                                             org.omg.CORBA.Object o);
//          throw excep when typecode inconsistent with value
abstract public void                   insert_Object(
                                             org.omg.CORBA.Object o,
                                             org.omg.CORBA.TypeCode t)
                                                   throws org.omg.CORBA.MARSHAL;

abstract public String                  extract_string()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void                    insert_string(String s)
      throws org.omg.CORBA.DATA_CONVERSION, org.omg.CORBA.MAR-
SHAL;

abstract public String                  extract_wstring()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void                    insert_wstring(String s)
      throws org.omg.CORBA.MARSHAL;

// insert and extract typecode

abstract public org.omg.CORBA.TypeCode extract_TypeCode()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public voidinsert_TypeCode(
                                                   org.omg.CORBA.TypeCode t);

// insert and extract Principal

abstract public org.omg.CORBA.Principal extract_Principal()
      throws org.omg.CORBA.BAD_OPERATION;
abstract public void insert_Principal(
                                             org.omg.CORBA.Principal p);

// insert non-primitive IDL types

abstract public void insert_Streamable(
                              org.omg.CORBA.portable.Streamable s);

}
```

23.14 Mapping for Certain Nested Types

IDL allows type declarations nested within interfaces. Java does not allow classes to be nested within interfaces. Hence those IDL types that map to Java classes and that are declared within the scope of an interface must appear in a special "scope" package when mapped to Java.

IDL interfaces that contain these type declarations will generate a scope package to contain the mapped Java class declarations. The scope package name is constructed by appending `Package` to the IDL type name.

23.14.1 Example

```
// IDL

module Example {
    interface Foo {
        exception e1 {};
    };
};

// generated Java

package Example.FooPackage;
final public class e1 extends org.omg.CORBA.UserException
    {...}
```

23.15 Mapping for Typedef

Java does not have a typedef construct.

23.15.1 Simple IDL types

IDL types that are mapped to simple Java types may not be subclassed in Java. Hence any typedefs that are type declarations for simple types are mapped to the original (mapped type) everywhere the typedef type appears.

The IDL types covered by this rule are described in Section 23.3, "Mapping for Basic Types.

Helper classes are generated for all typedefs.

23.15.2 Complex IDL types

Typedefs for non arrays and sequences are "unwound" to their original type until a simple IDL type or user-defined IDL type (of the non typedef variety) is encountered.

Holder classes are generated for sequence and array typedefs only.

Example

```
// IDL

struct EmpName {
    string firstName;
    string lastName;
};
typedef EmpName EmpRec;

// generated Java
//          regular struct mapping for EmpName
//          regular helper class mapping for EmpRec

final public class EmpName {
    ...
}

public class EmpRecHelper {
    ...
}
```

23.16 Mapping Pseudo Objects to Java

23.16.1 Introduction

Pseudo objects are constructs whose definition is usually specified in "IDL", but whose mapping is language specified. A pseudo object is not (usually) a regular CORBA object. Often it exposed to either clients and/or servers as a process, or a thread local, programming language construct.

For each of the standard IDL pseudo-objects we either specify a specific Java language construct or we specify it as a **pseudo interface**.

This mapping is based on the revised version 1.1 C++ mapping.

Pseudo Interface

The use of **pseudo interface** is a convenient device which means that most of the standard language mapping rules defined in this specification may be mechanically used to generate the Java. However, in general the resulting construct is not a CORBA object. Specifically it is:

- not represented in the Interface Repository
- no helper classes are generated
- no holder classes are generated
- mapped to a Java `public abstract class` that does not extend or inherit from any other classes or interfaces

Note: The specific definition given for each piece of PIDL may override the general guidelines above. In such a case, the specific definition takes precedence.

All of the pseudo interfaces are mapped as if they were declared in:

```
module org {
    module omg {
        module CORBA {
            ...
```

That is, they are mapped to the `org.omg.CORBA` Java package.

23.16.2 Certain Exceptions

The standard CORBA PIDL uses several exceptions, **Bounds**, **BadKind**, and **InvalidName**.

No holder and helper classes are defined for these exceptions, nor are they in the interface repository., However so that users can treat them as "normal exceptions" for programming purposes, they are mapped as normal user exceptions.

They are defined within the scopes that they are used. A **Bounds** and **BadKind** exception are defined in the `TypeCodePackage` for use by **TypeCode**. A **Bounds** exception is defined in the standard CORBA module for use by **NVList**, **ExceptionList**, and **ContextList**. An **InvalidName** exception is defined in the `ORBPackage` for use by **ORB**.

```
// Java

package org.omg.CORBA;

final public class Bounds
    extends org.omg.CORBA.UserException {
    public Bounds() {...}
}

package org.omg.CORBA.TypeCodePackage;

final public class Bounds
    extends org.omg.CORBA.UserException {
    public Bounds() {...}
}
final public class BadKind
    extends org.omg.CORBA.UserException {
    public BadKind() {...}

}

package org.omg.CORBA.ORBPackage;

final public class InvalidName
    extends org.omg.CORBA.UserException {
    public InvalidName() {...}
}
```

23.16.3 Environment

The **Environment** is used in request operations to make exception information available.

```
// Java code

package org.omg.CORBA;

public abstract class Environment {
    void exception(java.lang.Exception except);
    java.lang.Exception exception();
    void clear();
}
```

23.16.4 NamedValue

A **NamedValue** describes a name, value pair. It is used in the DII to describe arguments and return values, and in the context routines to pass property, value pairs.

In Java it includes a name, a value (as an any), and an integer representing a set of flags.

```
typedef unsigned long Flags;
typedef string Identifier;
const Flags ARG_IN = 1;
const Flags ARG_OUT = 2;
const Flags ARG_INOUT = 3;
const Flags CTX_RESTRICT_SCOPE = 15;

pseudo interface NamedValue {
    readonly attribute Identifier name;
    readonly attribute any value;
    readonly attribute Flags flags;
};
```

```
// Java

package org.omg.CORBA;

public interface ARG_IN {
    public static final int value = 1;
}
public interface ARG_OUT {
    public static final int value = 2;
}
public interface ARG_INOUT {
    public static final int value = 3;
}
```

```
public interface CTX_RESTRICT_SCOPE {
    public static final int value = 15;
}

public abstract class NamedValue {
    public abstract String name();
    public abstract Any value();
    public abstract int flags();
}
```

23.16.5 NVList

A **NVList** is used in the DII to describe arguments, and in the context routines to describe context values.

In Java it maintains a modifiable list of **NamedValue**s.

```
pseudo interface NVList {
    readonly attribute unsigned long count;
    NamedValue add(in Flags flags);
    NamedValue add_item(in Identifier item_name, in Flags flags);
    NamedValue add_value(in Identifier item_name,
                         in any val,
                         in Flags flags);
    NamedValue item(in unsigned long index) raises (CORBA::Bounds);
    void remove(in unsigned long index) raises (CORBA::Bounds);
};

// Java

package org.omg.CORBA;

public abstract class NVList {
    public abstract int count();
    public abstract NamedValue add(int flags);
    public abstract NamedValue add_item(String item_name, int flags);
    public abstract NamedValue add_value(String item_name, Any val,
                                         int flags);
    public abstract NamedValue item(int index)
                throws org.omg.CORBA.Bounds;
    public abstract void remove(int index) throws org.omg.CORBA.Bounds;
}
```

23.16.6 ExceptionList

An **ExceptionList** is used in the DII to describe the exceptions that can be raised by IDL operations.

It maintains a list of modifiable list of **TypeCode**s.

```
pseudo interface ExceptionList {
    readonly attribute unsigned long count;
    void add(in TypeCode exc);
    TypeCode item (in unsigned long index) raises (CORBA::Bounds);
    void remove (in unsigned long index) raises (CORBA::Bounds);
};
```

```
// Java

package org.omg.CORBA;

public abstract class ExceptionList {
    public abstract int count();
    public abstract void add(TypeCode exc);
    public abstract TypeCode item(int index)
                throws org.omg.CORBA.Bounds;
    public abstract void remove(int index)
                throws org.omg.CORBA.Bounds;
}
```

23.16.7 Context

A **Context** is used in the DII to specify a context in which context strings must be resolved before being sent along with the request invocation.

```
pseudo interface Context {
    readonly attribute Identifier context_name;
    readonly attribute Context parent;
    Context create_child(in Identifier child_ctx_name);
    void set_one_value(in Identifier propname, in any propvalue);
    void set_values(in NVList values);
    void delete_values(in Identifier propname);
    NVList get_values(in Identifier start_scope,
                    in Flags op_flags,
                    in Identifier pattern);
};
```

```
// Java

package org.omg.CORBA;

public abstract class Context {
    public abstract String context_name();
    public abstract Context parent();
    public abstract Context create_child(String child_ctx_name);
    public abstract void set_one_value(String propname,
                                       Any propvalue);
    public abstract void set_values(NVList values);
    public abstract void delete_values(String propname);
    public abstract NVList get_values(String start_scpe, int op_flags,
                                String pattern);
}
```

23.16.8 ContextList

```
pseudo interface ContextList {
    readonly attribute unsigned long count;
    void add(in string ctx);
    string item(in unsigned long index) raises (CORBA::Bounds);
    void remove(in unsigned long index) raises (CORBA::Bounds);
};

// Java

package org.omg.CORBA;

public abstract class ContextList {
    public abstract int count();
    public abstract void add(String ctx);
    public abstract String item(int index)
        throws org.omg.CORBA.Bounds;
    public abstract void remove(int index)
        throws org.omg.CORBA.Bounds;
}
```

23.16.9 Request

```
pseudo interface Request {
    readonly attribute Object target;
    readonly attribute Identifier operation;
    readonly attribute NVList arguments;
    readonly attribute NamedValue result;
    readonly attribute Environment env;
    readonly attribute ExceptionList exceptions;
readonly attribute ContextList contexts;

    attribute Context ctx;

    any add_in_arg();
    any add_named_in_arg(in string name);
    any add_inout_arg();
    any add_named_inout_arg(in string name);
    any add_out_arg();
    any add_named_out_arg(in string name);
    void set_return_type(in TypeCode tc);
any return_value();

    void invoke();
    void send_oneway();
    void send_deferred();
    void get_response();
    boolean poll_response();
};

// Java

package org.omg.CORBA;

public abstract class Request {

    public abstract Object target();
    public abstract String operation();
    public abstract NVList arguments();
    public abstract NamedValue result();
    public abstract Environment env();
    public abstract ExceptionList exceptions();
    public abstract ContextList contexts();

    public abstract Context ctx();
    public abstract void ctx(Context c);
```

```
    public abstract Any add_in_arg();
    public abstract Any add_named_in_arg(String name);
    public abstract Any add_inout_arg();
    public abstract Any add_named_inout_arg(String name);
    public abstract Any add_out_arg();
    public abstract Any add_named_out_arg(String name);
    public abstract void set_return_type(TypeCode tc);
    public abstract Any return_value();

    public abstract void invoke();
    public abstract void send_oneway();
    public abstract void send_deferred();
    public abstract void get_response();
    public abstract boolean poll_response();
}
```

It is permissible to retrieve the result or call the `return_value()` method before issuing the **Request**. Changes made to the **Any** which stores the result may be used by the implementation to improve performance. For example, one may insert a `Streamable` into the **Any** containing the return value before invoking the **Request**. Because **Any**s provide reference semantics, the result will be marshalled directly into the `Streamable` object avoiding additional marshalling if the **Any** were extracted after invocation.

23.16.10 ServerRequest and Dynamic Implementation

```
pseudo interface ServerRequest {
    Identifier op_name();
    Context ctx();
    void params(in NVList parms);
    void result(in Any res);
    void   except(in Any ex);
} ;

// Java

package org.omg.CORBA;

public abstract class ServerRequest {
    public abstract String op_name();
    public abstract Context ctx();
    public abstract void params(NVList parms);
    public abstract void result(Any a);
    public abstract void except(Any a);
```

The `DynamicImplementation` interface defines the interface such a dynamic server is expect to implement. Note that it inherits from the base class for stubs and skeletons (see Section , “Portable ObjectImpl).

```
// Java

package org.omg.CORBA;

public abstract class DynamicImplementation
        extends org.omg.CORBA.portable.ObjectImpl {
    public abstract void invoke(org.omg.CORBA.ServerRequest request);
}
```

23.16.11 TypeCode

The deprecated **parameter** and **param_count** methods are not mapped.

```
enum TCKind {
    tk_null, tk_void,
    tk_short, tk_long, tk_ushort, tk_ulong,
    tk_float, tk_double, tk_boolean, tk_char,
    tk_octet, tk_any, tk_TypeCode, tk_Principal, tk_objref,
    tk_struct, tk_union, tk_enum, tk_string,
    tk_sequence, tk_array, tk_alias, tk_except,
    tk_longlong, tk_ulonglong, tk_longdouble,
    tk_wchar, tk_wstring, tk_fixed
};
```

```
// Java

package org.omg.CORBA;

public final class TCKind {
    public static final int _tk_null = 0;
    public static final
        TCKind tk_null = new TCKind(_tk_null);

}
```

23.16.12 ORB

Issue – create_named_value() is incorrect in the CORBA spec. We have used the correct definition here. It is indicated as a change to CORBA 2.0

The **UnionMemeberSeq**, **EnumMemberSeq**, and **StructMemberSeq** typedefs are real IDL and bring in the Interface Repository. Rather than tediously list its interfaces, and other assorted types, suffice it to say that it is all mapped following the rules for IDL set forth in this specification in this chapter.

StructMember[], UnionMember[], EnumMember[]

```
pseudo interface ORB {

    exception InvalidName {};

    typedef string ObjectId;
typedef sequence<ObjectId> ObjectIdList;

    ObjectIdList list_initial_services();
    Object resolve_initial_references(in ObjectId object_name)
        raises(InvalidName);

    string object_to_string(in Object obj);
Object string_to_object(in string str);

    NVList create_list(in long count);
    NVList create_operation_list(in OperationDef oper);
    NamedValue create_named_value(in String name, in Any value,
                    in Flags flags);
    ExceptionList create_exception_list();
ContextList create_context_list();

    Context get_default_context();
Environment create_environment();

    void send_multiple_requests_oneway(in RequestSeq req);
    void send_multiple_requests_deferred(in RequestSeq req);
    boolean poll_next_response();
Request get_next_response();

// typecode creation

    TypeCode create_struct_tc (          in RepositoryId id,
                                         in Identifier name,
                      in StructMemberSeq members);
```

```
    TypeCode create_union_tc (              in RepositoryId id,
                                            in Identifier name,
                                            in TypeCode discriminator_type,
                        in UnionMemberSeq members);

    TypeCode create_enum_tc (               in RepositoryId id,
                                            in Identifier name,
                        in EnumMemberSeq members);

    TypeCode create_alias_tc (              in RepositoryId id,
                                            in Identifier name,
                        in TypeCode original_type);

    TypeCode create_exception_tc (          in RepositoryId id,
                                            in Identifier name,
                        in StructMemberSeq members);

    TypeCode create_interface_tc (          in RepositoryId id,
                        in Identifier name);

    TypeCode create_string_tc (             in unsigned long bound);

                                        java.util.Properties props);

}
```

23.16.13 CORBA::Object

The IDL **Object** type is mapped to the **org.omg.CORBA.Object and org.omg.CORBA.ObjectHelper** classes as shown below.

The Java interface for each user defined IDL **interface** extends **org.omg.CORBA.Object**, so that any object reference can be passed anywhere a **org.omg.CORBA.Object** is expected.

```
// Java

package org.omg.CORBA;

public interface Object {
    boolean _is_a(String Identifier);
    boolean _is_equivalent(Object that);
    boolean _non_existent();
    int _hash(int maximum);
    org.omg.CORBA.Object _duplicate();
    void _release();
    InterfaceDef _get_interface();
    Request _request(String s);
    Request _create_request(Context ctx,
                            String operation,
                            NVList arg_list,
                            NamedValue result);
    Request _create_request(Context ctx,
                            String operation,
                            NVList arg_list,
                            NamedValue result,
                            ExceptionList exclist,
                            ContextList ctxlist);
    Policy _get_policy(int policy_type);
    DomainManager[] _get_domain_managers();
    org.omg.CORBA.Object _set_policy_override(Policy[],
                            SetOverrideType set_add);
}
```

23.16.14 Principal

```
pseudo interface Principal {
attribute sequence<octet> name;
}
```

```
// Java

public abstract class Principal {
    public abstract byte[] name();
    public abstract void name(byte[] name);
}
```

23.17 Server-Side Mapping

23.17.1 Introduction

This section discusses how implementations create and register objects with the ORB runtime.

This chapter is subject to revision pending completion of the Java Portablility and Server Side Portability RFP.

The final adopted revised version will be patterned after the server framework architecture to be described by the final submission to the Server Side Portability RFP.

Issue – This chapter is subject to revision pending the outcome of the Portability RFP submission

23.17.2 Transient Objects

For this initial submission only a minimal API to allow application developers to implement transient ORB objects is described. We do not expect there to be major changes as a result of the Portability work.

Servant Base Class

For each IDL interface ***<interface_name>*** the mapping defines a Java class as follows:

```
// Java

public class _<interface_name>ImplBase implements <interface_name> {
}
```

Servant Class

For each interface, the developer must write a servant class. Instances of the servant class implement ORB objects. Each instance implements a single ORB object, and each ORB object is implemented by a single servant.

Each object implementation implements ORB objects that supports a most derived IDL interface. If this interface is **<interface_name>**, then the servant class must extend ***_<interface_name>*`ImplBase`**.

The servant class must define public methods corresponding to the operations and attributes of the IDL interface supported by the object implementation, as defined by the mapping specification for IDL interfaces. Providing these methods is sufficient to satisfy all abstract methods defined by ***_<interface_name>*`ImplBase`**.

Creating A Transient ORB Object

To create an instance of an object implementation, the developer instantiates the servant class.

Connecting a Transient ORB Object

Object implementations (object references) may be explicitly connected to the ORB by calling the ORB's **`connect()`** method (seeSection 23.16.12, "ORB).

An object implementation may also be automatically and implicitly connected to the ORB if it is passed as a (mapped IDL) parameter to a (mapped) IDL operation that is itself not implemented as a local (Java) object. I.e., it has to be marshaled and sent outside of the process address space. Note, a vendor is free to connect such an object implementation "earlier" (e.g. upon instantiation), but it must connect the implementation to the ORB when it is passed as described above.

Note that calling **`connect()`** when an object is already connected has no effect.

Disconnecting a Transient ORB Object

The servant may disconnect itself from the ORB by invoking the ORB's **`disconnect()`** method (see Section 23.16.12, "ORB). After this method returns, incoming requests will be rejected by the ORB by raising the **CORBA::OBJECT_NOT_EXIST** exception. The effect of this method is to cause the ORB object to appear to be destroyed from the point of view of remote clients.

Note that calling **`disconnect()`** when the object is not connected has no effect.

Note however, that requests issued using the servant directly (e.g. using the implementatioon's this pointer) do not pass through the ORB; these requests will continue to be processed by the servant.

23.17.3 Persistent Objects

Issue – dependent upon the Portability specification

23.18 Java ORB Portability Interfaces

23.18.1 Introduction

The APIs specified here provide the minimal set of functionality to allow portable stubs and skeletons to be used with a Java ORB. The interoperability requirements for Java go beyond that of other languages. Because Java classes are often downloaded and come from sources that are independent of the ORB in which they will be used, it is essential to define the interfaces that the stubs and skeletons use. Otherwise, use of a stub (or skeleton) will require: either that it have been generated by a tool that was provided by the ORB vendor (or is compatible with the ORB being used), or that the entire ORB runtime be downloaded with the stub or skeleton. Both of these scenarios are unacceptable.

Design Goals

The design balances several goals:

- Size
  Stubs and skeletons must have a small bytecode footprint in order to make downloading fast in a browser environment and to minimize memory requirements when bundled with a Java VM, particularly in specialized environments such as set-top boxes.
- Performance
  Obviously, the runtime performance of the generated stub code must be excellent. In particular, care must be taken to minimize temporary Java object creation during invocations in order to avoid Java VM garbage collection overhead.
- Reverse Mapability
  The design does not require adding methods to user-defined types such as structures and exceptions to ensure that stubs and skeletons generated by IDL to Java compilers and reverse Java to IDL mapping tools are interoperable and binary compatible.

A very simple delegation scheme is specified here. Basically, it allows ORB vendors maximum flexibility for their ORB interfaces, as long as they implement the interface APIs. Of course vendors are free to add proprietary extensions to their ORB runtimes. Stubs and skeletons which require proprietary extensions will not necessarily be portable or interoperable and may require download of the corresponding runtime.

Portability Package

The APIs needed to implement portability are found in the **`org.omg.CORBA.portable`** package

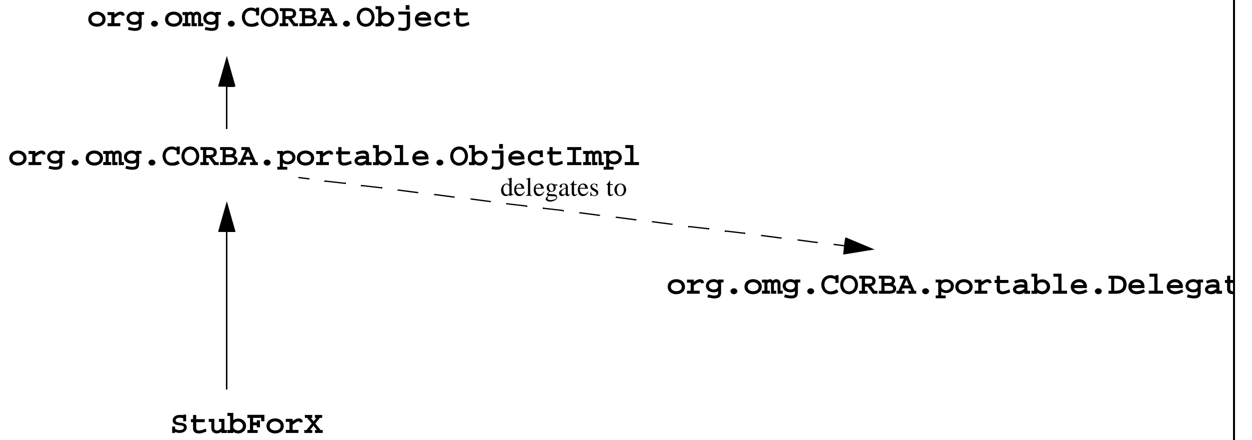
The portability package contains interfaces and classes that are designed for and intended to be used by ORB implementors. It exposes the publicly defined APIs that are used to connect stubs and skeletons to the ORB.

23.18.2 Architecture

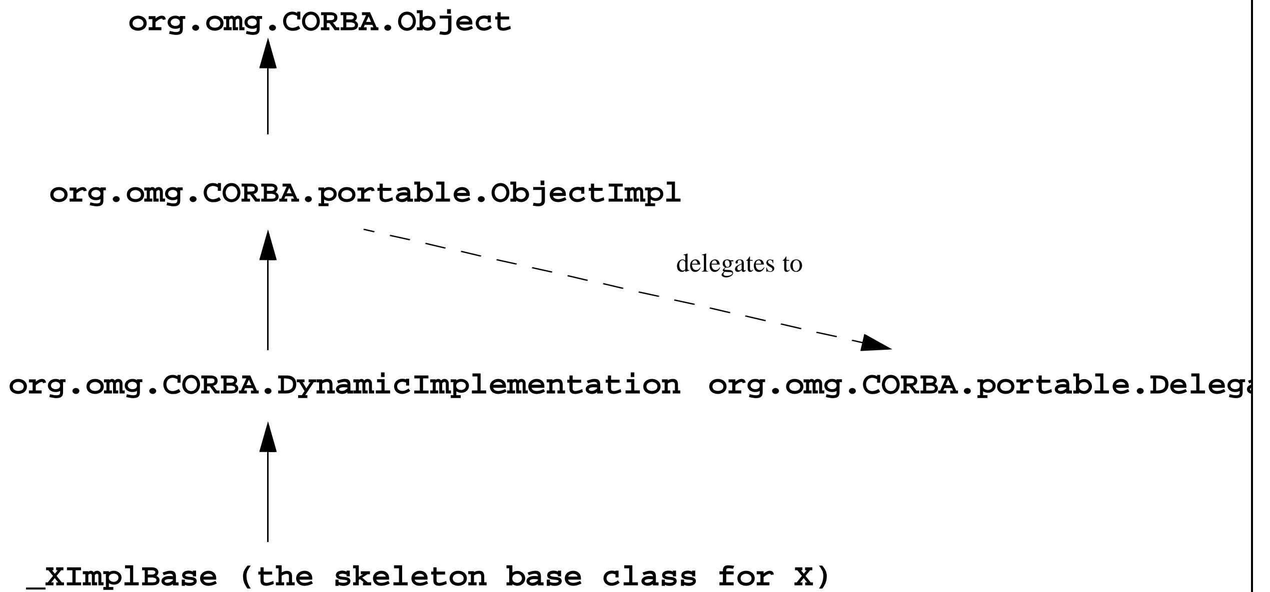
The stub and skeleton portability architecture allows the use of the DII and DSI as its portability layer. The mapping of the DII and DSI PIDL have operations that support the efficient implementation of portable stubs and skeletons

All stubs shall inherit from a common base class **`org.omg.CORBA.portable.ObjectImpl`**. The class is responsible for delegating shared functionality such as is_a() to the vendor specific implementation. This model provides for a variety of vendor dependent implementation choices, while reducing the client-side and server "code bloat".

All DSI-based skeletons inherit from **`org.omg.CORBA.DynamicImplementation`**.



Inheritance Relationships: Stub for Interface X
org.omg.CORBA.Object
org.omg.CORBA.portable.ObjectImpl
delegates to
org.omg.CORBA.portable.Delegat
StubForX



Inheritance Relationships: DSI Skeleton for Interface X
org.omg.CORBA.Object
org.omg.CORBA.portable.ObjectImpl
delegates to
org.omg.CORBA.DynamicImplementation
org.omg.CORBA.portable.Delega
_XImplBase (the skeleton base class for X)

23.18.3 Streamable APIs

The Streamable Interface API provides the support for the reading and writing of complex data types. It is implemented by static methods on the Helper classes. They are also used in the Holder classes for reading and writing complex data types passed as out and inout parameters.

```
package org.omg.CORBA.portable;

public interface Streamable {
    void _read(org.omg.CORBA.portable.InputStream istream);
    void _write(org.omg.CORBA.portable.OutputStream ostream);
    org.omg.CORBA.TypeCode _type();
}
```

23.18.4 Streaming APIs

The streaming APIs are Java interfaces that provide for the reading and writing of all of the mapped IDL types to and from streams. Their implementations are used inside the ORB to marshal parameters and to insert and extract complex datatypes into and from `Any`s.

The streaming APIs are found in the `org.omg.CORBA.portable` package.

The ORB object is used as a factory to create an output stream. An input stream may be created from an output stream.

```
package org.omg.CORBA;

interface ORB {
        OutputStream          create_output_stream();
};

package org.omg.CORBA.portable;

public abstract class InputStream extends java.io.InputStream {
    public void read() throws java.io.IOException {
        throw new org.omg.CORBA.NO_IMPLEMENT();
        };
    public abstract boolean   read_boolean();
    public abstract char      read_char();
    public abstract char      read_wchar();
    public abstract byte      read_octet();
    public abstract short     read_short();
    public abstract short     read_ushort();
    public abstract int       read_long();
    public abstract int       read_ulong();
    public abstract long      read_longlong();
    public abstract long      read_ulonglong();
    public abstract float     read_float();
    public abstract double    read_double();
    public abstract String    read_string();
    public abstract String    read_wstring();
    public abstract void      read_boolean_array(boolean[] value,
                                      int offset, int length);
    public abstract void      read_char_array(char[] value,
                                      int offset, int length);
    public abstract void      read_wchar_array(char[] value,
                                      int offset, int length);
    public abstract void      read_octet_array(byte[] value,
                                      int offset, int length);
    public abstract void      read_short_array(short[] value,
                                      int offset, int length);
    public abstract void      read_ushort_array(short[] value,
                                      int offset, int length);
    public abstract void      read_long_array(int[] value,
```

```
                                              int offset, int length);
    public abstract void        read_ulong_array(int[] value,
                                              int offset, int length);
    public abstract void        read_longlong_array(long[] value,
                                              int offset, int length);
    public abstract void        read_ulonglong_array(long[] value,
                                              int offset, int length);
    public abstract void        read_float_array(float[] value,
                                              int offset, int length);
    public abstract void        read_double_array(double[] value,
                                              int offset, int length);
    public abstract org.omg.CORBA.Object        read_Object();
    public abstract org.omg.CORBA.TypeCode      read_TypeCode();
    public abstract org.omg.CORBA.Any           read_any();
    public abstract org.omg.CORBA.Principal     read_Principal();
}

public abstract class OutputStream extends java.io.OutputStream {
    public void write(int b) throws java.io.IOException {
        throw new org.omg.CORBA.NO_IMPLEMENT();
        };

    public abstract InputStream create_input_stream();
    public abstract void write_boolean      (boolean value);
    public abstract void write_char         (char value);
    public abstract void write_wchar        (char value);
    public abstract void write_octet        (byte value);
    public abstract void write_short        (short value);
    public abstract void write_ushort       (short value);
    public abstract void write_long         (int value);
    public abstract void write_ulong        (int value);
    public abstract void write_longlong     (long value);
    public abstract void write_ulonglong    (long value);
    public abstract void write_float        (float value);
    public abstract void write_double       (double value);
    public abstract void write_string       (String value);
    public abstract void write_wstring      (String value);
    public abstract void write_boolean_array(boolean[] value,
                                        int offset, int length);
    public abstract void write_char_array(char[] value,
                                        int offset, int length);
    public abstract void write_wchar_array(char[] value,
                                        int offset, int length);
    public abstract void write_octet_array(byte[] value,
                                        int offset, int length);
    public abstract void write_short_array(short[] value,
                                        int offset, int length);
    public abstract void write_ushort_array(short[] value,
                                        int offset, int length);
    public abstract void write_long_array(int[] value,
                                        int offset, int length);
```

```
    public abstract void write_ulong_array(int[] value,
                                            int offset, int length);
    public abstract void write_longlong_array(long[] value,
                                            int offset, int length);
    public abstract void write_ulonglong_array(long[] value,
                                            int offset, int length);
    public abstract void write_float_array(float[] value,
                                            int offset, int length);
    public abstract void write_double_array(double[] value,
                                            int offset, int length);
    public abstract void write_Object(org.omg.CORBA.Object value);
    public abstract void write_TypeCode(org.omg.CORBA.TypeCode value);
    public abstract void write_any (org.omg.CORBA.Any value);
    public abstract void write_Principal(org.omg.CORBA.Principal value);
}
```

23.18.5 Portability Stub Interfaces

Stub Design

The stub class is implemented on top of the DII..

Portable ObjectImpl

The ObjectImpl class is the base class for stubs and skeletons. It provides the basic delegation mechanism.

The method _ids() returns an array of repository ids that an object implements. The string at the zero index shall represent the most derived interface. The last id, for the generic CORBA object (i.e. “IDL:omg.org/CORBA/Object:1.0”), is implied and not present.

```
package org.omg.CORBA.portable;

abstract public class ObjectImpl implements
                                        org.omg.CORBA.Object {

    private transient Delegate __delegate;

    public Delegate _get_delegate() {
        if (__delegate == null) {
            throw new org.omg.CORBA.BAD_OPERATION();
        }
        return _delegate;
    }

    public void _set_delegate(Delegate delegate) {
        __delegate = delegate;
    }
```

```
    public abstract String[] _ids() {...}

// methods for standard CORBA stuff

    public org.omg.CORBA.InterfaceDef
                                    _get_interface() {
        return _get_delegate().get_interface(this);
    }

    public org.omg.CORBA.Object _duplicate() {
        return _get_delegate().duplicate(this);
    }

    public void _release() {
        _get_delegate().release(this);
    }

    public boolean _is_a(String repository_id) {
        return _get_delegate().is_a(this, repository_id);
    }

    public boolean _is_equivalent(org.omg.CORBA.Object rhs) {
        return _get_delegate().is_equivalent(this, rhs);
    }

    public boolean _non_existent() {
        return _get_delegate().non_existent(this);
    }

    public int _hash(int maximum) {
        return _get_delegate().hash(this, maximum);
    }

    public org.omg.CORBA.Request _request(String operation) {
        return _get_delegate().request(this, operation);
    }

    public org.omg.CORBA.Request _create_request(
                        org.omg.CORBA.Context ctx,
          String operation,
          org.omg.CORBA.NVList arg_list,
          org.omg.CORBA.NamedValue result) {
        return _get_delegate().create_request(this, ctx,
                              operation, arg_list, result);
    }
```

```
public Request _create_request(
                                org.omg.CORBA.Context ctx,
          String operation,
          org.omg.CORBA.NVList arg_list,
          org.omg.CORBA.NamedValue result,
            org.omg.CORBA.ExceptionList exceptions,
          org.omg.CORBA.ContextList contexts) {
      return _get_delegate().create_request(this, ctx, operation,
                                arg_list, result,exceptions, contexts);
}

public Policy _get_policy(int polcy_type) {
      return _get_delegate().get_policy(this, policy_type);
}
public DomainManager[] _get_domain_managers() {
      return _get_delegate().get_domain_managers(this);
}
public org.omg.CORBA.Object _set_policy_override(
                        Policy [] policies,
                        SetOverrideType set_add) {
            return _get_delegate().set_policy_override(
                              this, policies, set_add);
}

public org.omg.CORBA.ORB _orb() {
      return _get_delegate().orb(this);
}

}
```

23.18.6 Delegate

The delegate class provides the ORB vendor specific implementation of CORBA object.

```
// Java

package org.omg.CORBA.portable;

public abstract class Delegate {

    public abstract org.omg.CORBA.InterfaceDef get_interface(
                                    org.omg.CORBA.Object self);
    public abstract org.omg.CORBA.Object duplicate(
                                    org.omg.CORBA.Object self);
    public abstract void release(org.omg.CORBA.Object self);
    public abstract boolean is_a(org.omg.CORBA.Object self,
                                    String repository_id);
    public abstract boolean non_existent(org.omg.CORBA.Object self);
    public abstract boolean is_equivalent(org.omg.CORBA.Object self,
                                    org.omg.CORBA.Object rhs);
    public abstract int hash(org.omg.CORBA.Object self
                                    int max);
    public abstract org.omg.CORBA.Request request(org.omg.CORBA.Object self,
                                    String operation);
    public abstract org.omg.CORBA.Request create_request(
                                    org.omg.CORBA.Object self,
                                    org.omg.CORBA.Context ctx,
                                    String operation,
                                    org.omg.CORBA.NVList arg_list,
                                    org.omg.CORBA.NamedValue result);
    public abstract org.omg.CORBA.Request create_request(
                                    org.omg.CORBA.Object self,
                                    org.omg.CORBA.Context ctx,
                                    String operation,
                                    org.omg.CORBA.NVList arg_list,
                                    org.omg.CORBA.NamedValue result,
                                    org.omg.CORBA.ExceptionList excepts,
                                    org.omg.CORBA.ContextList contexts);
    public org.omg.CORBA.Policy get_policy(
                    org.omg.CORBA.Object self,
                    int policy_type) {
        throw new org.omg.CORBA.NO_IMPLEMENT();
    }
    public org.omg.CORBA.DomainManager[] get_domain_managers(
                    org.omg.CORBA.Object self) {
        throw new org.omg.CORBA.NO_IMPLEMENT();
    }
    public org.omg.CORBA.Object set_policy_override(
            org.omg.CORBA.Object self,
            org.omg.CORBA.Policy[] policies,
```

```
            org.omg.CORBA.SetOverrideType set_add) {
        throw new org.omg.CORBA.NO_IMPLEMENT();
    }

    public abstract org.omg.CORBA ORB orb(
                            org.omg.CORBA.Object self);

}
```

23.18.7 Skeleton

The skeleton uses the DynamicImplementation (seeSection 23.16.10, “ServerRequest and Dynamic Implementation).

See Section , “Servant Class for more information.

23.18.8 ORB Initialization

The ORB class represents an implementation of a CORBA ORB. Vendors specific ORB implementations can extend this class to add new features.

There are several cases to consider when creating the ORB instance. An important factor is whether an applet in a browser or an stand-alone Java application is being used.

In any event, when creating an ORB instance, the class names of the ORB implementation are located using the following search order:

- check in Applet parameter or application string array, if any
- check in properties parameter, if any
- check in the System properties
- fall back on a hardcoded default behavior

Standard Properties

The OMG standard properties are defined in the following table.

Table 23-2 Standard ORB properties

Property Name	Property Value
org.omg.CORBA.ORBClass	**class name of an ORB implementation**
org.omg.CORBA.ORBSingleton Class	**class name of the singleton ORB implementation**

ORB Initialization Methods

There are three forms of initialization as shown below. In addition the actual ORB implementation (subclassed from `ORB`) must implement the `set_parameters()` methods so that the initialization parameters will be passed into the ORB from the initialization methods.

```
// Java

package org.omg.CORBA;

abstract public class ORB {

    // Application init

    public static ORB init(String[] args,
                                        java.util.Properties props) {
        // call to: set_parameters(args, props);
        ...
        }

    // Applet init

    public static ORB init(java.applet.Applet app,
                                        java.util.Properties props) {
        // call to: set_parameters(app, props);
        ...
        }
```

```
    // Default (singleton) init

    public static ORB init()
        {...}

    // Implemented by subclassed ORB implementations
    //    and called by init methods to pass in their params

    abstract protected void set_parameters(String[] args,
                                java.util.Properties props);
    abstract protected void set_parameters(Applet app,
                                java.util.Properties props);

}
```

Default initialization

The default initialization method returns the singleton ORB. If called multiple times it will always return the same the Java object.

The primary use of the no-argument version of **ORB.init()** is to provide a factory for **TypeCode**s for use by Helper classes implementing the **type()** method, and to create Any instances that are used to describe union labels as part of creating a union **TypeCode**. These Helper classes may be baked-in to the browser (e.g. for the interface repository stubs or other wildly popular IDL) and so may be shared across untrusted applets downloaded into the browser. The returned ORB instance is shared across all applets and therefore must have sharply restricted capabilities so that unrelated applets can be isolated from each other. It is not intended to be used directly by applets. Therefore, the ORB returned by **ORB.init()**, if called from a Java applet, may only be used to create **Typecode**s.

The following list of ORB methods are the only methods which may be called on the singleton ORB. An attempt to invoke any other ORB meethod shall raise the system exception **NO_IMPLEMENT**.

- **create_list()**
- **create_named_value()**
- **create_exception_list()**
- **create_context_list()**
- **get_default_context()**
- **create_environment()**
- **create_xxx_tc(),** where **xxx** is one the defined typecode types
- **get_primitive_tc()**
- **create_any()**
- **create_output_stream()**

Application initialization

The application initialization method should be used from a stand-alone Java application. It is passed a array of strings which are the command arguments and a list of Java properties. Either the argument array or the properties may be **`null`**.

It returns a new fully functional ORB Java object each time it is called.

Applet initialization

The applet initialization method should be used from an applet. It is passed "the applet" and a list of Java properties. Either the applet or the properties may be **`null`**.

It returns a new fully functional ORB Java object each time it is called.Mapping of OMG IDL to Java

Dynamic Invocation Interface 5

This section of the report describes the changes to Chapter 5. These changes are required in order to clarify the behavior of NV Lists in order to support the Java Portable Stub APIs. The current specification permits ORBs to have differing storage allocation policies which leads to binary incompatbilities.

5.4.1 create_list

This operation, which creates a pseudo-object, is defined in the ORB interface and excerpted below.

```
Status create_list (                                          //PIDL
    in long          count,      // number of items to allocate for
list
    out NVList       new_list    // newly created list
);
```

This operation allocates a list and clears it for initial use. The specified count is a “hint” to help with storage allocation. List items may be added to the list using the **add_item** routine. Items are added starting with the “slot 0”, in the next available slot. .

An **NVList** is a partially opaque structure. It may only be allocated via a call to **create_list.**

5.4.5 get_count

```
Status get_count (                                            // PIDL
    out long              count       // number of entries in the list
);
```

This operation returns the total number of items added to this list.
