

# **High Performance, Federated and Service-Oriented Geographic Information Systems**

**Ahmet Sayar**

# **\*TENTATIVE\* TABLE OF CONTENTS**

## **CHAPTER 1 INTRODUCTION**

- 1.1. Motivation
- 1.2. Methodology
- 1.3. Research Issues
- 1.4. Summary of Thesis Contribution
- 1.5. Thesis Outline

## **CHAPTER 2 LITERATURE SURVEY**

- 2.1. Background
  - 2.1.1. Geographic Information Systems (GIS)
  - 2.1.2. Open Geospatial Standards
  - 2.1.3. Web Services and Service Oriented Architectures
  - 2.1.4. Web Services for GIS
  - 2.1.5. Geospatial Data Types and Common Data Formats
- 2.2. Related Works
  - 2.2.1. Linked Environments for Atmospheric Discovery (LEAD)
  - 2.2.2. Geosciences Network (GEON)

## **CHAPTER 3                    HIGH PERFORMANCE FEDERATED SERVICE-ORIENTED GIS**

### 3.1. Capability-file based GIS Federation

### 3.2. System Components

#### 3.2.1. User Portal: Interactive Smart Map Tools

#### 3.2.2. Web Feature Service (WFS)

#### 3.2.3. Web Map Service (WMS)

#### 3.2.4. Web Map Service Aggregator (AWMS)

### 3.3. Capability-File

#### 3.3.1. Capability?

#### 3.3.2. Capability Definition for WFS

#### 3.3.3. Capability Definition for WMS

### 3.4. Aggregator Service (AWMS) Providing Unified Access to Heterogeneous Sources

#### 3.4.1. Integrated View

#### 3.4.2. Unified querying over integrated view

### 3.5. Chaining of the Components for Federation

#### 3.5.1. Chaining MWS with WMS

#### 3.5.2. Chaining WMS with WFS

#### 3.5.3. Chaining WFS with WFS

### 3.6. Mediators for Federating Other GIS Map Services

3.6.1. Federating Google Maps

3.6.2. Federating NON-Web Service Open Standard WMSs

3.7. Enhancing System Performance

3.7.1. General Characteristic Performance Problems

3.7.1. Data transfer and handling

3.7.2. Parsing and rendering semi-structured (XML) common data

3.7.3. Pre-fetching (for un-frequently changing data)

3.7.4. Parallel processing and caching (for frequently changing data)

## **CHAPTER 4          APPLICATIONS OF THE PROPOSED SYSTEM**

4.1. Coupling the Proposed GIS Data System with Geo-Science Applications

4.1.1. Integrating the System with Other CGL Lab projects for Geo-Science Applications.

4.1.2. Three-layer structured display and Sci-Plotting Service

4.1.3. Interactive decision making tools

4.1.4. Use Case Scenarios on Real Geo-Science Applications

4.1.4.1. Pattern Informatics (PI)

4.1.4. 2. Virtual California (VC)

4.1.4.3. Interdependent Energy Infrastructure Simulation System (IEISS)

4.2. Animating Time-Series Data as Streaming Map Movies

4.2.1. Time-Series Data Animation

4.2.2. Streaming Map Movies Architecture for GIS

4.2.2.1. Invocation Stage

4.2.2.2. Data Retrieval Stage

4.2.2.3. Frames (Static Map Image) Creation Stage

4.2.2.4. Map Streams Creation and publishing Stage

4.2.3. Browser-based Map Animation Techniques

4.2.4. Future Research Directions on Streaming Map Movies

4.2.5. Evaluation of Integration Approach

## **CHAPTER 5            ABSTRACTION OF THE SYSTEM FOR THE OTHER DOMAINS**

5.1. Requirements of the general Capability-file based federation

5.2. Requirements for Capability-file

5.3. From WMS to ASVS (Application Specific Visualization Service)

5.4. From WFS to ASFS (Application Specific Feature Service)

5.5. Common data model ASL (Application Specific Language)

[Some other Issues – I need to work more]

## **CHAPTER 6            PERFORMANCE TESTS (Based on the Issues in Chapter 3.4)**

6.1. Introduction

6.2. Test Methodology and Environment

6.3. Test Results

6.3.1. Data Transfer (Streaming vs. Non-Streaming)

6.3.2. XML (GML) parsing- rendering and XSL translations

6.3.3. Pre-fetched data vs. on-demand data querying and display

6.3.4. Parallel processing for on-demand data

6.3.4.1. Latency from parallel processing

6.4. Evaluation of the Test Results

## **CHAPTER 7            CONCLUSION AND FUTURE WORK**

7.1. Conclusion

7.2. Summary of Answers to Research Questions

7.3. Future Research Directions

APPENDICES
